# 2021 | Cyber Security Report

# Delivering safety and security to a remotely connected world

---

The global COVID-19 pandemic has challenged all of us to live and work differently. As we have been urged to keep social distancing to prevent the spread of coronavirus, many of us are feeling frustrated at being unable to enjoy simple things in life. I hope the coronavirus will be eradicated as soon as possible. However, some people consider that we need to learn to live with coronavirus while navigating “the new normal.”

Looking back over the past one year, we have utilized various forms of digital services more extensively than ever before. Connecting with people remotely is becoming increasingly the norm for us in all spheres of life as we interact with people via social media, do shopping online without going out, use home delivery services, take online classes, and telework most days of the week. When viewed from a different perspective, this situation is advantageous to those who are using the Internet for criminal purposes. It is therefore necessary to enhance the security of the cyberspace in order to protect society from cybercrime.

Engaged in the energy, social infrastructure, electronic device, and digital solution businesses, Toshiba Group is currently committed to transforming into an infrastructure service company that supports people’s lives. Toshiba Group possesses extensive experience and expertise in *monozukuri*—the art, science, and craft of making things—cultivated for 145 years since its founding in 1875. By leveraging such experience and expertise, we would like to deliver safety and security not only in the physical world but also in a remotely connected world.

The purpose of Cyber Security Report 2021 is to provide our customers, shareholders, suppliers, and other stakeholders with information about Toshiba Group’s initiatives to enhance cybersecurity. We hope it will allay any security concerns you may have so that you will select Toshiba’s products and services with confidence.

Executive Officer,  
Corporate Senior  
Vice President and CISO  
Toshiba Corporation

**Hideaki Ishii**

## Toshiba Group's Manifesto on Cyber Security

---

# With unwavering determination to protect society from invisible threats

---

With rapid digitization of everyday life, cyber-crimes have become common nowadays. All of a sudden, anyone could be deprived of their valuable assets or involved in an outrageous crime.

As an enterprise that supports people's lives, Toshiba Group has endeavored to afford **safety and security** to society and its customers. Leveraging extensive experience and expertise cultivated through more than 145 years of history, we offer electricity supply, public transportation, and other infrastructure services as well as data services using cutting-edge digital technologies. We would like to contribute to the betterment of people's lives and culture in both physical and cyber realms. As these services can be a target of cyberattacks, security enhancement is one of the most crucial issues.

To protect society from invisible threats, Toshiba Group works with one accord to establish a robust **cyber security system**, comply with the related laws and regulations, and develop cyber security specialists while being committed to active and honest information disclosure to customers.

We accord the highest priority to the protection of customers' privacy. Therefore, we consider it crucial to properly manage personal data acquired through our business activities in order to prevent its leakage and unauthorized use. In the event of a security incident, we will do our utmost to **minimize damage**, identify its cause, and expedite the recovery of the affected system.

With firm resolve, we commit ourselves to protecting society from invisible threats.

# The Essence of Toshiba

The Essence of Toshiba is the basis for the sustainable growth of the Toshiba Group and the foundation of all corporate activities.

The Essence of Toshiba comprises three elements: Basic Commitment of the Toshiba Group, Our Purpose, and Our Values.

With Toshiba's Basic Commitment kept close to heart, we clarified our purpose – the difference that Toshiba Group makes in society – together with our values, the shared beliefs that guide our actions.

---

## Basic Commitment of the Toshiba Group

### Committed to People, Committed to the Future.

At Toshiba, we commit to raising the quality of life for people around the world, ensuring progress that is in harmony with our planet.

---

## Our Purpose

We are Toshiba. We have an unwavering drive to make and do things that lead to a better world.

A planet that's safer and cleaner.  
A society that's both sustainable and dynamic.  
A life as comfortable as it is exciting

That's the future we believe in.  
We see its possibilities, and work every day to deliver answers that will bring on a brilliant new day.

By combining the power of invention with our expertise and desire for a better world, we imagine things that have never been – and make them a reality.

That is our potential. Working together, we inspire a belief in each other and our customers that no challenge is too great, and there's no promise we can't fulfill.

### We turn on the promise of a new day.

---

## Our Values

### Do the right thing

We act with integrity, honesty and openness, doing what's right – not what's easy.

### Look for a better way

We continually strive to find new and better ways, embracing change as a means for progress.

### Always consider the impact

We think about how what we do will change the world for the better, both today and for generations to come.

### Create together

We collaborate with each other and our customers, so that we can grow together.

# Visions and Strategies

As an infrastructure service company, Toshiba Group aims to become one of the world's leading cyber-physical systems (CPS) technology enterprises through integration of cyber and physical technologies so as to fulfill its role in solving social issues. A CPS is a mechanism to 1) collect physical data, 2) analyze the collected data in cyber space as typified by the cloud where a huge amount of computing resources is available such as artificial intelligence (AI) and other analysis technologies, 3) translate the analysis results into easy-to-use information, and 4) feed it back to the physical realm so as to help realize an efficient and sustainable society. On the other hand, with digital transformation spurred by the progress of the Internet of Things (IoT), myriad physical devices are becoming connected to the network, increasing the threat of cyberattacks against CPS systems. Within the purview of this threat now are not only information systems but also control systems and products, exposing social infrastructure to ever-greater risk of cyber-induced physical damage.

Toshiba Group possesses extensive expertise in the physical realm cultivated through more than 145 years of experience in various business areas as well as know-how for information security acquired from the operation of information systems supporting roughly 120,000 employees. As an enterprise promoting cyber-physical integration, we consider that it is our responsibility to combine both cyber and physical expertise to enhance cyber security, aiming to ensure the safety and security of our products, systems, and services and to support customers' business continuity.

## Toshiba's Cyber Security Visions

Infrastructure service company envisioned by Toshiba Group

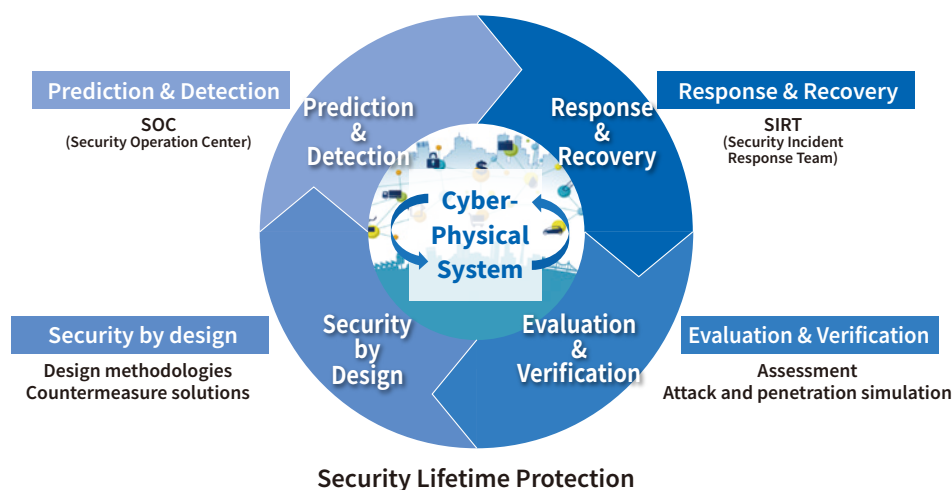

Toshiba Group possesses extensive knowledge and expertise in social infrastructure and other sectors as well as a huge amount of supporting data. Toshiba Group also has world-leading cyber technologies, including advanced information processing, digital, and AI technologies. Our forte lies in the CPS technologies that combine physical technologies cultivated since our founding with these world-leading cyber technologies. Our strength also includes extensive expertise in the infrastructure business that is the driving force for the creation of new value. We aspire to realize social infrastructure services that will help resolve various issues facing humankind. Through digital transformation, we will endeavor to deliver social infrastructure to help resolve a multitude of challenges confronting the world such as global warming, climate change, natural disasters, antiquated infrastructure, "new normal" adaptation, population aging, and labor shortages.

## Toshiba Group's cyber security visions

Digital transformation is progressing in a wide range of industrial and social sectors through the use of IoT, AI, cloud, and other digital technologies. However, as myriad physical devices become interconnected via networks, cyber threats are expanding to include control systems and devices for social infrastructure, exposing them to the increasing risk of cyber-induced physical damage. Even under these circumstances, the mission of Toshiba Group remains the same—to support the business continuity of its customers and help realize a safe and secure society. To fulfill this mission, it is essential to accurately assess the convenience of digital technologies and the risk of cyber threats and accordingly shift the focus from conventional protection-oriented security measures to sustainable security solutions encompassing both information and control systems.

In view of this, Toshiba Group is endeavoring to enhance cyber security not only for internal information systems and production systems at its factories and other facilities but also for its products, systems, and services to be offered to customers. Its initiatives are aimed not only to enhance security via security by design\* at the design and development stages but also to predict and be prepared for security risks at the operational stage by constantly monitoring internal and external security threats. Toshiba Group quickly responds to security incidents to minimize damage and expedite business recovery in the event of an incident. We also emphasize “security lifetime protection,” a concept stressing the importance of sustainable security that incorporates the evaluation and verification of up-to-the-minute security threats and their countermeasures as well as feedback to the design and development processes of products and services.

\*Security-by-design : A product development approach that focuses on security at the planning and design stages

To realize this, Toshiba Group defines cyber security management as a series of organically connected processes from six perspectives: 1) governance, 2) protection, 3) prediction and detection, 4) response and recovery, 5) evaluation and verification, and 6) personnel. Toshiba Group has set its goals as “Toshiba Cyber Security Visions” from these perspectives. To attain these goals, we endeavor to enhance our cyber security initiatives so as to remain a trusted partner for our customers through the provision of our products and services.

<b>Governance</b>	Continuously increasing the maturity level of cyber security management through PDCA cycles	
<b>Protection</b>	Proper implementation of product and system development processes to prevent vulnerabilities	
<b>Prediction &amp; Detection</b>	Real-time detection of internal and external security threats that could affect Toshiba Group or its products	
<b>Response &amp; Recovery</b>	Prompt minimization of damage and swift business recovery in the event of security incidents	
<b>Evaluation &amp; verification</b>	Evaluating and verifying products and systems so as to be prepared to respond to new vulnerabilities	
<b>Personnel</b>	Training and enhancement of necessary security personnel	

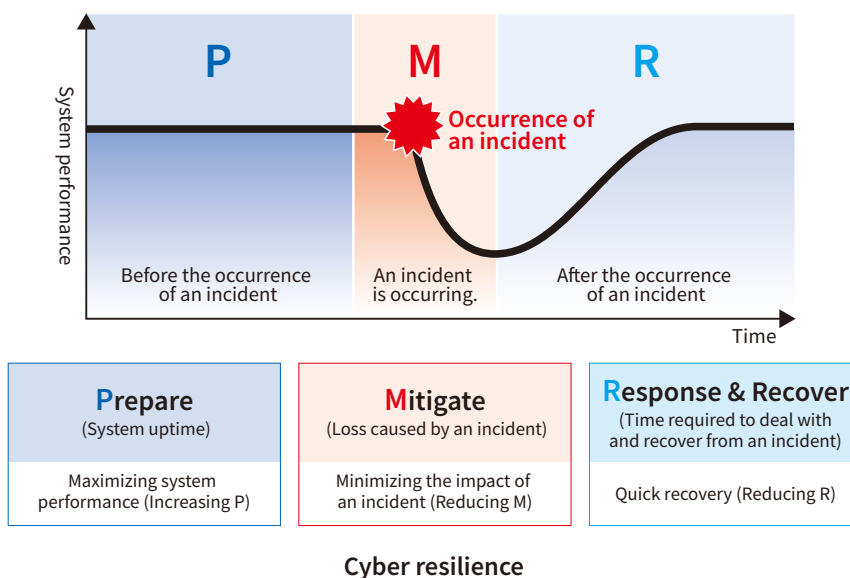

### Goals of Toshiba Group

# Strategies for Enhancing Cyber Security Preparedness

Infrastructure services are the core of Toshiba Group's business. The scope of the required cyber security is changing. Previously, security concerns were restricted to two fields: 1) information security for an organization's networks, PCs and servers and 2) product security that emphasized the importance of enhancing product security quality. Nowadays, the scope of security is expanding to include 3) control security, i.e., the security required to ensure proper operation of industrial infrastructure and 4) data security for the handling of physical data in cyber space.

Under these circumstances, Toshiba Group has adopted a high-level security philosophy called "cyber resilience" in order to achieve comprehensive solutions for information, product, control, and data security. The word "resilience" means the ability to withstand or recover quickly from difficult conditions. The purpose of cyber resilience is to be prepared for cyberattacks and other security incidents so as to minimize their impact and facilitate prompt recovery from any incidents.

Toshiba Group has defined parameters that must be met to increase cyber resilience and thereby minimize the impact of security incidents on infrastructure systems. There are three parameters represented by PMR: P for "prepare," M for "mitigate," and R for "respond & recover." P denotes system uptime; M signifies a loss caused by an incident; and R indicates the time required to deal with and recover from an incident. To become cyber-resilient, it is necessary to increase P and reduce M and R.

Toshiba Group is strengthening its cyber security preparedness with the aim of achieving cyber resilience. Here, "cyber security preparedness" means a state fully prepared for extensive security risks. Specifically, it encompasses three elements: 1) governance to clarify decision-making processes and a chain of command in order to increase P and reduce M, 2) security operations, including prediction & detection, response & recovery, and protection, in order to reduce M and R, and 3) personnel responsible for the implementation and enhancement of these operations. These three elements should be enhanced and regularly maintained so that they are implemented in an orchestrated manner.

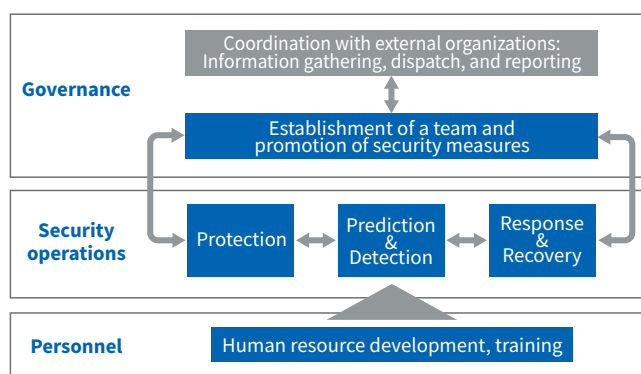

First, to reinforce security governance, Toshiba Group set up the post of the Chief Information Security Officer (CISO) in November 2017, to whom the authority over information security was delegated from the Chief Executive Officer (CEO). CISO assumes full responsibility for the management of cyber security risks and facilitates decision-making for grave security incidents that could affect business management. A chain of command was defined so that CISO can promptly provide precise directions for group companies.

At the same time, Toshiba Group established the Cyber Security Center, which consolidates the CSIRT<sup>\*1</sup> responsible for addressing security risks concerning information assets and personal data stored in in-house information systems and the PSIRT<sup>\*2</sup> responsible for managing security risks concerning products, systems, and services provided by Toshiba Group. The CSIRT and PSIRT cooperate to ensure that all systems at Toshiba's factories and other facilities are properly secured. The Cyber Security Center strives to enhance the cyber security governance of Toshiba Group, incorporating security rules into in-house regulations, establishing security management systems at group companies, addressing cyber security vulnerabilities at the product development and post-shipment stages, and standardizing the risk evaluation policy. In addition, the Cyber Security Center provides a single channel of contact for security-related organizations in Japan and abroad while group companies have a point of contact for liaison with the Cyber Security Center, promoting the sharing of internal and external information.

To strengthen security operations such as prediction & detection, response & recovery, and protection, the Cyber Security Center is currently developing a security management platform called the Cyber Defense Management Platform (CDMP)<sup>\*3</sup>. The purpose of CDMP is to increase the accuracy and expediency of security risk detection and response and thereby enhance cyber resilience. The CDMP is designed to automate the “prediction and detection” and “response and recovery” processes and actively use threat intelligence<sup>\*4</sup> in order to minimize the impact of security risks on corporate activities.

In April 2019, Toshiba Group established the Cyber Security Technology Center at the Corporate Research & Development Center, where in-house security experts are gathered to reinforce security personnel. The roles of the Cyber Security Technology Center encompass R&D, technical support, and implementation assistance regarding cyber security technology. In order to develop security personnel across Toshiba Group, Toshiba Group provides education on information security, personal data protection, and product security for all employees with the aim of enhancing security consciousness. In addition, Toshiba Group endeavors to improve security quality at the product development stage while offering education and qualification programs designed to develop security personnel responsible for dealing with security incidents.

**Cyber security management processes**

The following sections describe the specific measures that we are currently implementing in relation to governance, security operations, and human resource development.

\*1 Computer Security Incident Response Team

\*2 Product Security Incident Response Team

\*3 CDMP : Cyber Defense Management Platform

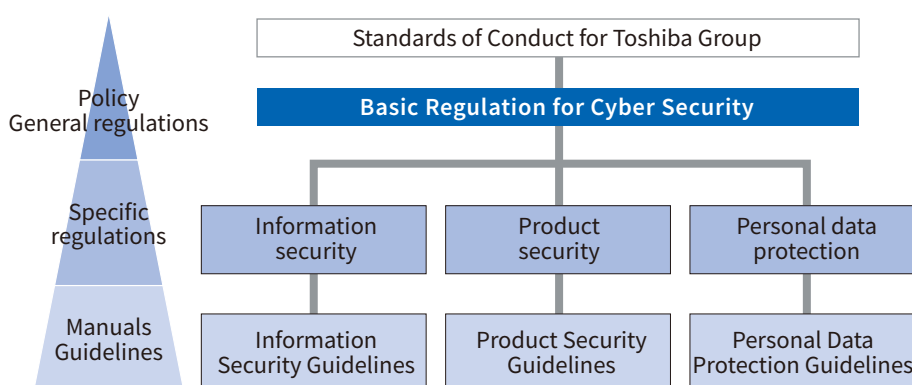

\*4 Threat intelligence: A collection of information about cyber threat trends and cyberattacks by hackers that supports decision-making concerning cyber security

## Governance

Toshiba Group has established the Basic Regulation for Cyber Security that stand above the regulations on information security, product security, and personal data protection. The purpose of the Basic Regulation for Cyber Security is to ensure the promotion of consistent security measures across Toshiba Group for its internal information systems; our products, systems, and services; and the personal data possessed by the Group.

### Basic policy

Toshiba Group properly manages cyber security risk that could have a severe impact on corporate management and has a management system in place that is designed to cope with various types of cyberattacks. In addition, Toshiba Group endeavors to maintain social trust and establish supply chains that enable stable supply of high-quality products, systems, and services by cultivating a corporate culture that prioritizes safety and security and by protecting information about customers, suppliers, and individuals.

Toshiba Group's regulations related to cyber security

### Basic policy on information security management

Toshiba Group regards all information, such as personal data, customer information, management information, technical and production information handled during the course of business activities, as its important assets and adopts a policy to manage all corporate information as confidential information and to ensure that the information is not inappropriately disclosed, leaked or used. In view of this, Toshiba has a fundamental policy "to manage and protect such information assets properly, with top priority on compliance." The policy is stipulated in the chapter "Corporate Information and Company Assets" of the Standards of Conduct for Toshiba Group, and managerial and employee awareness on the same is encouraged.

### Basic Policy on Product Safety and Product Security

In keeping with the Standards of Conduct for Toshiba Group on Product Safety and Product Security, Toshiba Group endeavors to comply with relevant laws and regulations, to ensure product safety and product security, and also to proactively disclose reliable safety information to our customers. Furthermore, we continually research safety-related standards and technical standards (UL Standards<sup>\*1</sup>, CE Marking<sup>\*2</sup> etc.) required by the countries and regions where we distribute products, and display the safety compliance of our products in accordance with the relevant standards and specifications.

\*1 UL standards: Safety standards established by UL LLC (Underwriters Laboratories Inc.) that develops standards for materials, products, and equipment and provides product testing and certification

\*2 CE marking: A certification mark that indicates conformity with the safety standards of the European Union (EU). The CE marking is required for products sold within the European Economic Area (EEA).

### Privacy policy

Toshiba Group protects personal data obtained from its stakeholders in the course of business activities appropriately in accordance with the Personal Information Protection Act, the related laws and regulations, national guidelines, and other rules, recognizing that personal data is an important asset of each stakeholder and also an important asset for Toshiba, leading to creation of new value. In addition, Toshiba Group endeavors to implement, maintain, and continually improve its personal data protection management system as per in-house regulations.

Toshiba's privacy policy: <https://www.global.toshiba/ww/privacy/corporate.html>

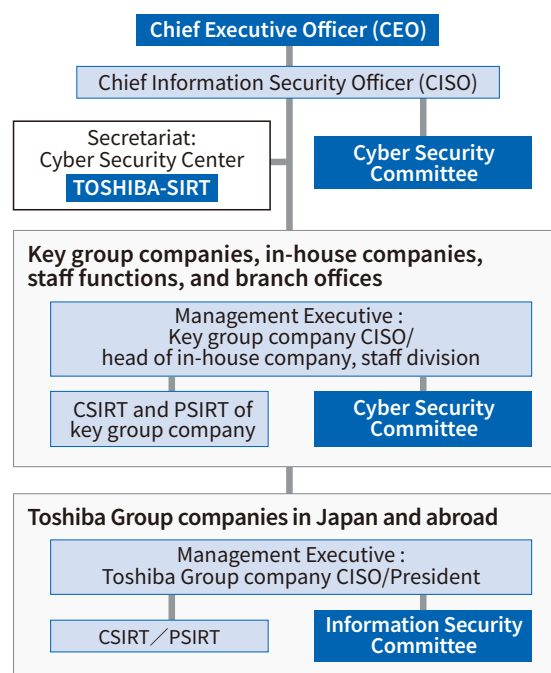

## Management System

To promote cyber security measures, Toshiba Group has established a cyber security management system under the direction of the CISO. The TOSHIBA-SIRT<sup>\*1</sup> assists the CISO in reviewing the following matters to be discussed by the Cyber Security Committee: the basic policy, project team, and action plans for the cyber security management of the entire Toshiba Group and how to respond to cyber security incidents that could develop into a major crisis. The TOSHIBA-SIRT, which has the functions of both CSIRT and PSIRT, supervises the cyber security measures of the entire Toshiba Group and provides support for all group companies in Japan and abroad.

Each key group company overseeing other subsidiaries also has a CISO, who is responsible for the implementation of security measures consistent with those of Toshiba Group and the establishment of a cyber security management system for the company. The CISO of each key group company assumes the responsibility for its own cyber security and that of the subsidiaries operating under its umbrella. In addition, the CSIRT of each company is responsible for implementing information security measures and responding to information security incidents whereas the PSIRT is responsible for implementing product security measures and responding to product vulnerabilities. The Cyber Security Committee<sup>\*2</sup> discusses matters necessary for the implementation of cyber security measures at key group companies and how to respond to cyber security incidents that could develop into a crisis.

\* 1 SIRT : Security Incident Response Team

\* 2 : In some cases, other committees perform the same functions.

Cyber Security Management Structure

## Toshiba Group CISO Meetings

Toshiba Group holds quarterly Toshiba Group CISO meetings where the CISOs of key group companies formulate and review its cyber security policies and measures. Toshiba Group operates in a wide range of industrial sectors, including energy, social infrastructure, electronic devices, and digital solutions, which require different cyber security frameworks. Therefore, at the Toshiba Group CISO meeting, we discuss cyber security strategies and policies common to the entire Toshiba Group while the CISOs of key group companies share the initiatives and issues of each group company so as to help resolve their respective issues.

In order to combat increasingly sophisticated cyberattacks, key group companies are enhancing cooperation to strengthen the overall cyber security capabilities of Toshiba Group.

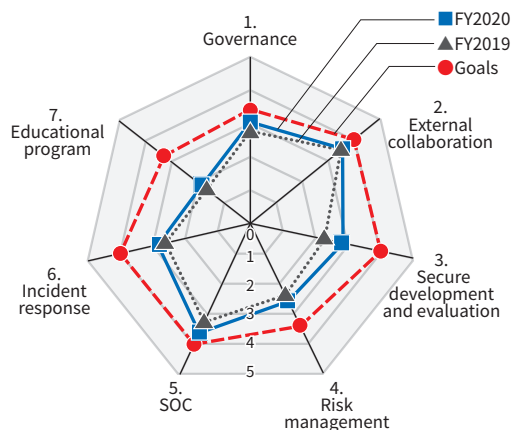

## Self-assessment of cyber security management maturity

In order to enhance the cyber security management level, Toshiba Group sets maturity goals and performs self-assessment designed to elevate the level of goal management. Maturity assessment is intended to visualize the gaps between current conditions and goals so that each group company can implement countermeasures to steadily improve its cyber security management maturity.

We assess both the information security level of the CSIRT and the product security level of the PSIRT. The basis of this assessment includes the SIM3<sup>\*1</sup> maturity model that is widely used worldwide, the Cybersecurity Management Guidelines of the Ministry of Economy, Trade and Industry (METI) of Japan, and the Cybersecurity Framework of the U.S. National Institute of Standards and Technology (NIST<sup>\*2</sup>). Maturity levels are graded on the scale of 1-5 in respect to 1) governance, 2) external collaboration, 3) secure development and evaluation, 4) risk management, 5) SOC, 6) incident response, and 7) educational program.

In 2020, overseas group companies performed maturity self-assessment to enhance their cyber security management levels.

Results of cyber security management maturity self-assessment

\*1 SIM3 : Security Incident Management Maturity Model  
 \*2 NIST : National Institute of Standards and Technology

## Activities for raising cyber security awareness

Endorsing Cybersecurity Month observed by the National Center of Incident Readiness and Strategy for Cybersecurity (NISC) of Japan, Toshiba Group observes February as Cybersecurity Month. The CISO of Toshiba Group delivers a message for Cybersecurity Month, focusing on cyber security trends of the year, including considerations for information security and the security measures for the products that Toshiba Group ships. In addition, in order to raise the security awareness of employees, we create a campaign poster to be displayed at each operating site and on the in-house web portal. To ensure cyber security, it is crucial to keep track of the latest trends and share information among all parties concerned. Therefore, we have formed a community to disseminate and share information, including domestic and international news on cyber security, vendor reports, news releases from industry associations, media reports about national policies, and press releases.

This message will be sent to employees of all Toshiba Group overseas companies.

To all Toshiba Group employees

**3 Basic Rules**

- Company PCs must be connected to the company network.
- Do not install unauthorized software.
- Use complicated, hard-to-guess passwords.

**February Cybersecurity Month**

As Toshiba Group's Chief Information Security Officer (CISO), I would like to share this message for Cybersecurity Month.

Exactly a year ago now, as part of our effort to enhance cybersecurity, Toshiba Group decided to observe February as Cybersecurity Month. At that time, there were 12 reported cases of COVID-19 in Japan, and few people anticipated its current spread. Toshiba Group responded to the pandemic and the government's declaration of a state of emergency by introducing remote work, and I thank you for your cooperation in this.

One response to the pandemic was a **global shift to working from home**, and other forms of remote work. **This has led to an increased number of cyberattacks on PCs outside corporate networks.** When you work remotely, make sure you **connect your PC to Toshiba's secure network**. If you are using a remote office, do not leave your PC or documents unattended when leaving your desk.

### Message for Cybersecurity Month from CISO

# Security Operations

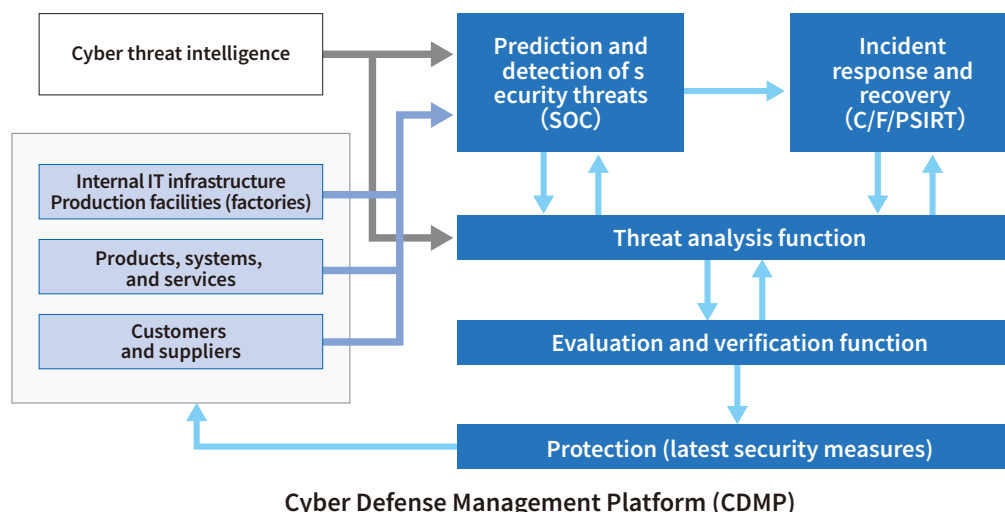

This section describes the initiatives undertaken by Toshiba Group to enhance its security operations. At present, Toshiba Group is developing a security management platform called the CDMP<sup>\*1</sup> with the aim of increasing the accuracy and expediency of security risk detection and response in order to enhance its cyber resilience. The CDMP is designed to automate the “prediction and detection” and “response and recovery” processes and actively use cyber threat intelligence<sup>\*2</sup> in order to minimize the impact of security risk on corporate activities.

\*1 CDMP: Cyber Defense Management Platform

\*2 Cyber threat intelligence: A collection of information about cyber threat trends and cyberattacks that supports decision-making concerning cyber security

## CDMP overview

The purpose of the CDMP is to protect not only internal IT infrastructure but also production facilities and factories, as well as the products, systems, and services offered to customers. In the future, the coverage of the CDMP will be extended to include customers' and suppliers' systems connected to them. Specifically, the CDMP provides the functions shown below, some of which commenced operation in January 2019.

**Cyber Defense Management Platform (CDMP)**

•SOC : Security Operation Center

•C/F/PSIRT : Computer/Factory/Product Security Incident Response Team

The CDMP consists of the following functions:

- Prediction and detection of security threats (SOC)
  - ⇒ Detecting security incidents by monitoring system states (see page 15)
- Incident response and recovery (C/F/PSIRT)
  - ⇒ Responding to security incidents and recovering the affected systems (see pages 17 and 23)
- Threat analysis function
  - ⇒ Preventing cyber threats by using threat intelligence (see page 20)
  - ⇒ Improving the analysis accuracy by accumulating knowledge and using artificial intelligence
- Evaluation and verification
  - ⇒ Evaluating and verifying products and systems from the hackers' perspective (see page 18)
- Protection
  - ⇒ Protection using state-of-the-art security measures (see page 19)

The threat to Toshiba Group is ever increasing. Since resources are limited, Toshiba Group is endeavoring to automate the response to and the recovery from security incidents while accumulating knowledge, sharing information via the dashboard, and using artificial intelligence to realize high-accuracy security operations with slim resources. To automate the use of threat intelligence, and the investigation of and response to security incidents, we are working on the deployment of a platform called SOAR (Security Orchestration, Automation and Response).

## Human Resources Development

This section describes Toshiba Group's programs for the development of cyber security personnel. In order to enhance security consciousness, Toshiba Group provides education on information security, personal data protection, and product security for all employees. In addition, Toshiba Group endeavors to develop highly skilled security personnel responsible for improving quality at the product development stage and for responding to security incidents. Toshiba Group also has a certification program to accelerate the development of security personnel.

### Education on information security and personal data protection

To prevent information leakage, each employee must acquire knowledge necessary to properly handle the information encountered in the course of work and enhance awareness of security threats such as targeted attacks. Toshiba Group provides all officers and employees with e-learning programs every year incorporating the latest information, including security considerations for teleworking, which are available in multiple languages for overseas employees. Toshiba Group also provides education about information security and personal data protection at career milestones such as at the time of employment and promotion.

Toshiba Group has created the Information Security Handbook that plainly describes the rules, regulations, and guidelines that all employees of Toshiba Group need to understand and act upon in the day-to-day performance of their duties.

### Product security education

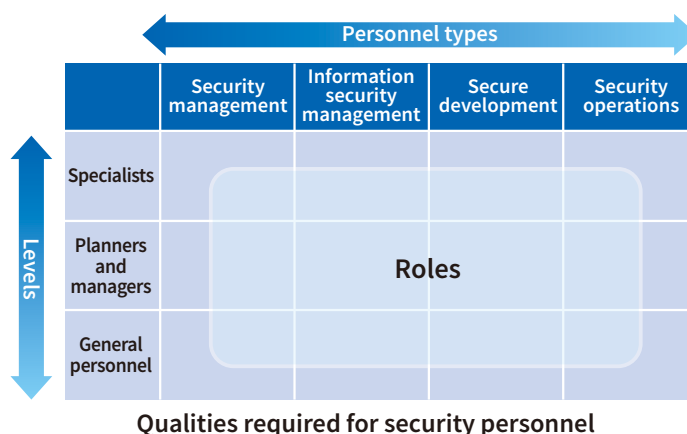

To ensure the security of products, systems, and services offered to customers, all employees involved in products, such as sales, procurement, design, development, quality, and maintenance personnel, must understand the significance of product security vulnerabilities as well as the importance of preventing the introduction of vulnerabilities at the product development stage and promptly addressing security vulnerabilities found in the products shipped. In addition to information security education, Toshiba Group provides all officers and employees with e-learning programs every year addressing product security risk.

### Training of advanced security personnel

In addition to the above education, Toshiba Group provides training for security personnel according to the types of their tasks and levels while defining the qualities of security personnel required. Training security personnel so as to ensure they possess the necessary specialized knowledge and expertise is not the only goal of human resource development. Toshiba Group also endeavors to train personnel so that they are capable of enhancing product security at the development stage and promptly responding to security vulnerabilities and incidents. In addition, Toshiba Group provides product security education for those in managerial positions. In order to ensure that product security practices are properly implemented in each department, Toshiba Group also provides product security education for those in managerial positions while endeavoring to develop cyber security personnel with extensive specialized knowledge and expertise capable of enhancing product security quality at the development stage and promptly responding to security vulnerabilities and incidents.

### Security certification program

Based on the above qualities required for security personnel, Toshiba Group has a certification program to certify security personnel who possess sufficient knowledge and expertise for each type of task and level. Certification criteria include attendance of internal and external security education courses, acquisition of Registered Information Security Specialist or other security-related certifications, and job experience expected for a given type of task and a level.

# Privacy Governance<sup>\*1</sup> Initiatives

Toshiba Group will continue to launch data services in years to come. Public demand for privacy protection is growing as the utilization of personal data expands.

Prior to the launching of a business using personal data, Toshiba Group has established a system and rules for the identification and evaluation of privacy risks. Minimizing privacy risks is crucial for using personal data for business purposes. Toshiba Group will also educate its employees on privacy protection in order to raise their awareness about privacy.

Toshiba Data Corporation, which provides data services, implemented a privacy governance initiatives ahead of other group companies as described below.

## Privacy Governance Initiatives of Toshiba Data Corporation

Toshiba Data Corporation, a wholly owned subsidiary of Toshiba Corporation, aspires to create a richer future through data services. The company collects various types of data, including purchase data from Smart Receipts<sup>®\*2</sup>, an application from Toshiba Tec Corporation, as well as personnel, healthcare, and behavior data regarding people's everyday life. After adding new value to these data upon consent from consumers, the company offers them for the benefit of society. To ensure the privacy of personal data, Toshiba Data initiated the following privacy governance program ahead of other group companies:

### Advisory Meeting on Privacy (first meeting held on March 25, 2020)

Toshiba Data organized the Advisory Meeting on Privacy consisting of external, independent specialists in order to receive advice about privacy protection from a neutral and fair perspective.

Members of the advisory meeting:

Chairman: Professor Ichiro Satoh, National Institute of Informatics (Specialty: Information and society)

Member: Associate Professor Naoto Ikegai, Department of Policy Studies, Faculty of Economics, Toyo University, till March 2021; Graduate School of Law, Hitotsubashi University, from April 2021 onward (Specialty: Information policy)

Member: Ms. Tomomi Hioki, Lawyer at Miura & Partners (Specialty: Data business)

Member: Professor Tatsuhiko Yamamoto, Keio University Law School (Specialty: Constitutional law)

Member: Ms. Sanae Okuhara, Joined the panel at the third meeting held on October 1, 2020; adviser to the Nippon Association of Consumer Specialists (Specialty: Consumer policies)

\*1 Privacy governance: Establishing and implementing a system for proper management of privacy risks and organizational efforts for privacy issues

\*2 Smart Receipts is a registered trademark of Toshiba Tec Corporation.

# Cyber Security Initiatives

In order to enhance cyber security, Toshiba has consolidated information and product security functions that were separately promoted before. Chapter 2 categorizes Toshiba Group's IT infrastructure and its products, systems, and services, and describes Toshiba Group's initiatives for enhancing cyber security. Here, internal IT infrastructure includes factories and other production facilities in addition to PCs, servers, networks, and other equipment within Toshiba Group.

## Security Measures for Internal IT Infrastructure

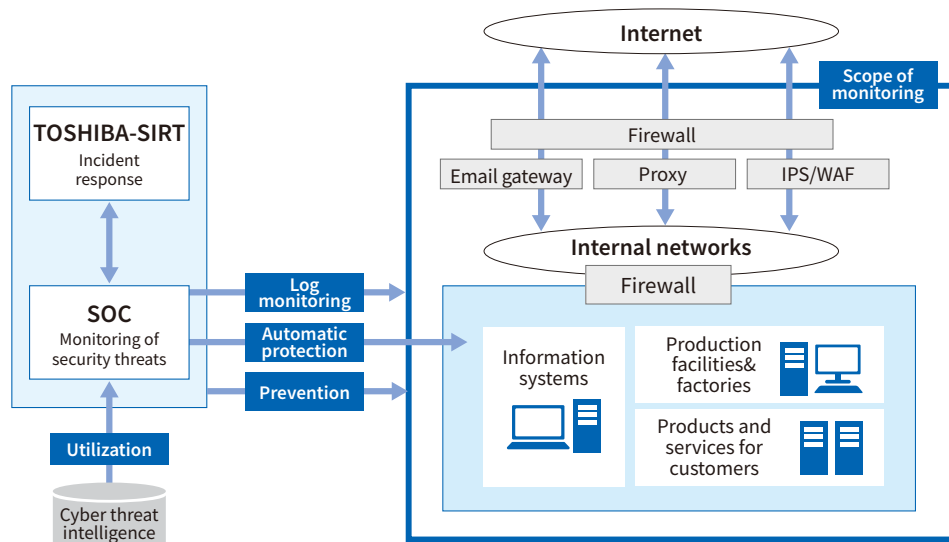

As cyberattacks are becoming increasingly sophisticated and ingenious, Toshiba Group is committed to proper management of customers' information assets. At Toshiba Group, the SOC is responsible for the prediction and detection of security threats while the CSIRT is dedicated to the response to and recovery from cyber security incidents. In addition, all the organizations of Toshiba Group in Japan and abroad perform an annual self-audit and security assessment and receive guidance.

### Enhancing Prediction and Detection

Previously, Toshiba Group prioritized the deployment of firewalls, intrusion prevention systems (IPS), and proxies at the Internet gateway to prevent attackers from breaching an internal network because all information assets to be protected used to be located only in the internal network. However, in view of the increasing reliance on public cloud services as a means of improving work efficiency and promoting work style innovation, the boundary between internal and external networks is becoming obscure. In addition, cyberattacks are shifting from random attacks on mass targets to targeted attacks on one specific organization designed to steal its confidential information or disrupt its business, exposing enterprises to an increased risk of cyberattacks. Under these circumstances, Toshiba Group is strengthening the following measures to detect security risks promptly and accurately and respond to them immediately:

- Expanding the scope of monitoring to cover not only IT systems but also factories and customer services
- Detecting not only external cyberattacks but also the internal spread of cyber intrusions and suspicious activities
- Standardizing and automating responses in the event of an alert being detected
- Risk-based security management using external threat intelligence

Security prediction and detection provided by the SOC

- SOC (Security Operation Center): An organization that monitors networks and devices 24/7/365, detects and analyzes cyberattacks, and provides advice about how to respond to them
- Firewall: A security barrier that controls communication ports to prevent software from performing unintended communications
- Gateway: Hardware or software that interfaces one network to another
- Proxy: A computer system that acts as an intermediary for communications between the Internet and an internal network
- Intrusion prevention system (IPS): A device or software that detects and blocks an intrusion into an internal network
- Web application firewall (WAF): A form of firewall that detects and blocks cyberattacks attempting to exploit vulnerabilities of Web applications

## Enhancing the Security of Endpoints\*<sup>1</sup> Using EDR\*<sup>2</sup> Tools

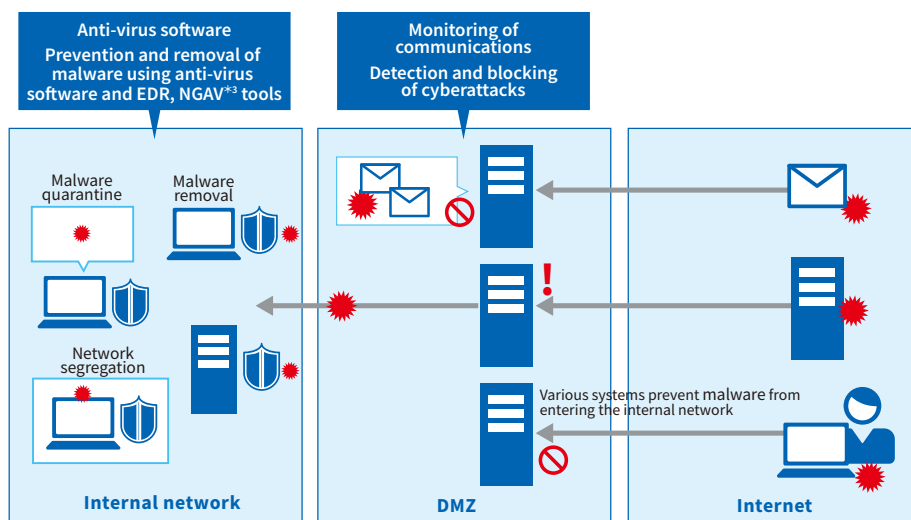

Toshiba Group is installing EDR tools on all PCs and servers in Japan and abroad, which are capable of detecting and blocking unknown malware that cannot be blocked by antivirus software as well as sophisticated cyberattacks that cannot be detected at the Internet gateway.

### Introduction of EDR tools

- Detecting suspicious network activities due to the infection of unknown malware that cannot be detected by existing anti-virus software
- Ability of the SOC to remotely quarantine the infected computers without disconnecting them from a network and remove security threats
- Tracking the causes and scope of damage from the collected operating log

\*1 Endpoints: PCs, servers, and information devices connected to a network

\*2 Endpoint detection and response: Detection of and response to security threats at endpoints

Introduction of EDR tools

- NGAV (Next Generation Anti-Virus)
- DMZ (demilitarized zone): A subnetwork added between an organization's secure internal network and an untrusted external network such as the Internet

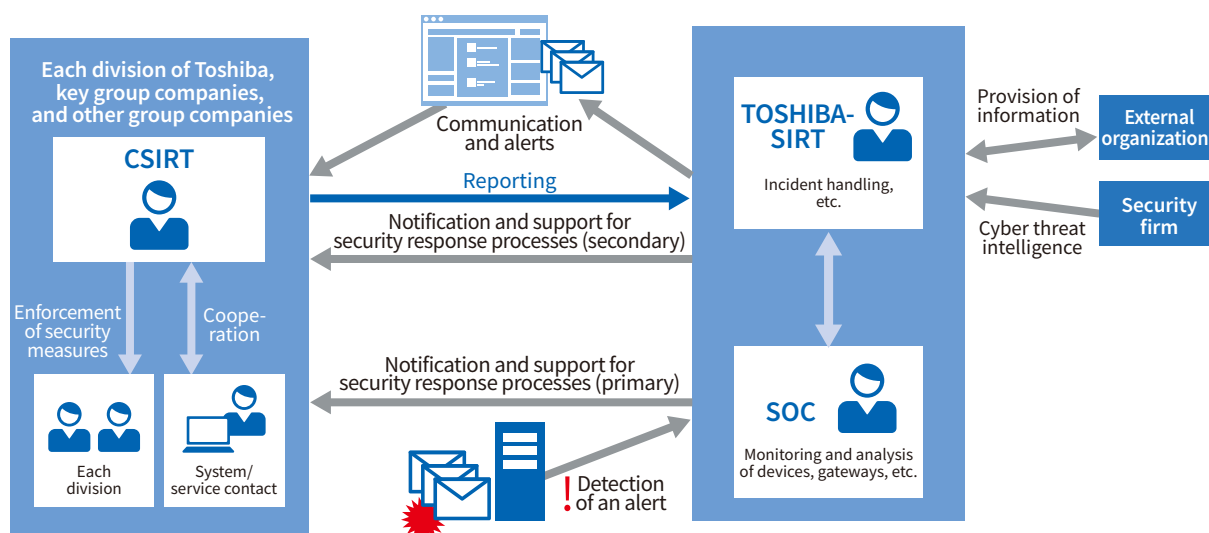

# Security Incident Response

As per the cyber security management system, a CSIRT\* is organized in each division of Toshiba, key group companies, and all the subsidiaries operating under their controls worldwide so as to be prepared to respond accurately and promptly in the event of a security incident. When an alert is detected, the SOC directly notifies the CSIRT of each division and group company of the alert in order to respond promptly while acting in concert with the TOSHIBA-SIRT.

\* CSIRT: Computer Security Incident Response Team

## Roles of the CSIRT

The CSIRTs of the division and of the group company supervising a given system are responsible for dealing with the security vulnerabilities and incidents involving that system. They ensure the implementation of various security measures to fix vulnerabilities and other issues and respond to security incidents in cooperation with IT and manufacturing departments. The TOSHIBA-SIRT is responsible for coordinating with each CSIRT to ensure that various security measures are properly implemented across the entire Toshiba Group and for minimizing damage in the event of a security incident. In particular, the TOSHIBA-SIRT deals with security incidents involving email and other shared systems, provides support for each CSIRT, and addresses security incidents that require cooperation of multiple divisions.

Outline of the security incident response procedure

## Security Incident Response

Security incidents include website tampering, targeted emailing, spam influx, unknown malware infection, and malware spreading. For all types of potential security incidents, the TOSHIBA-SIRT has predefined response procedures, which are continually reviewed and improved through training and actual response to security incidents. Business could be affected by some security measures, for example, a disconnection of a network to prevent the spread of malware. Even for such measures, the TOSHIBA-SIRT has established predefined procedures and the criteria for their implementation, which have been disseminated throughout the Toshiba Group so as to be able to respond promptly to any incidents and thereby minimize damage.

## Automation initiatives

To promptly and accurately respond to vulnerabilities and incidents 24/7/365, Toshiba Group is now automating the response to vulnerability information, cyber threat intelligence, and security alerts. We have categorized security information and alerts and developed routine response patterns, ensuring that any security incident can be handled by anyone, anytime. Furthermore, our automation initiatives include analyzing the relationships among the detected security alerts and cyber threat intelligence, identifying the root causes of the alerts, and establishing optimum response procedures.

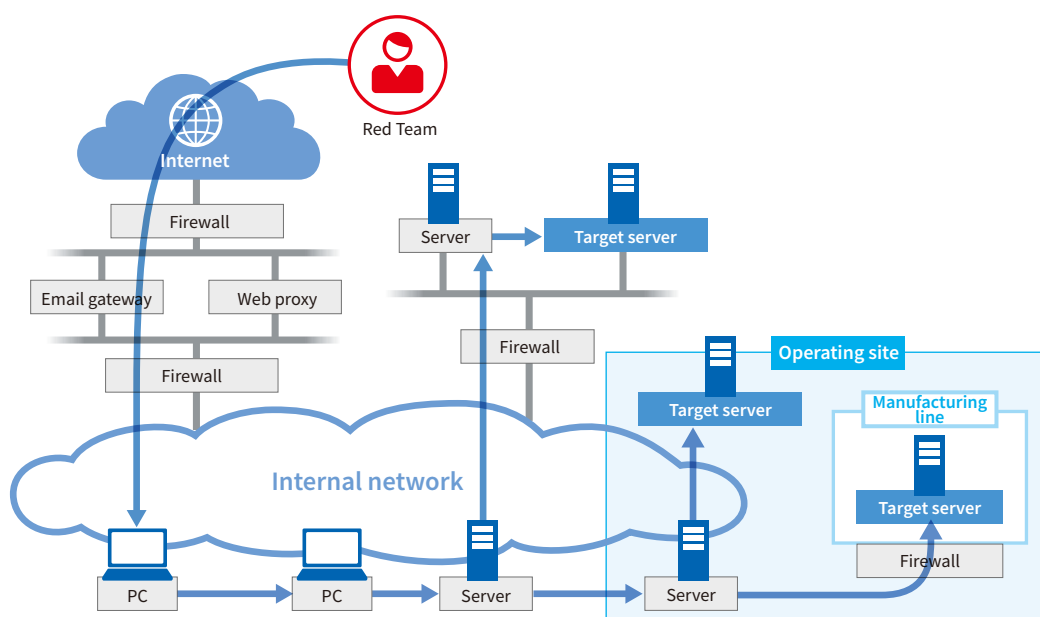

# Advanced Attack and Penetration Assessment from Hacker's Perspective

Targeted attacks, i.e., attacks that are uniquely destined for one specific enterprise or organization, are increasing, with cyber criminals focused on stealing its customer or confidential information. In the face of increasingly sophisticated cyber threats, Toshiba Group regularly takes an attack and penetration assessment from the Red Team\* of a specialized cyber security firm in order to validate the effectiveness of its security measures.

In this assessment, the Red Team attempts to penetrate Toshiba Group's network using advanced tactics, techniques, and procedures of real-world hackers, in order to determine whether it is possible to reach a target server through a simulated attack. The purposes of this assessment are to verify the effectiveness of the current security measures, identify potential weaknesses against cyberattacks, and consider additional measures.

\* Red Team: An independent team that provides real-world attack simulations designed to assess the effectiveness of security systems and measures of an organization

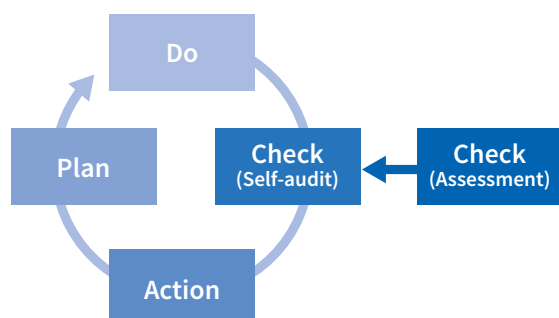

## Self-Audit and Security Assessment

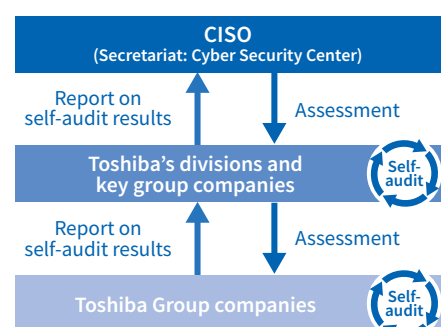

As Toshiba Group operates in various business sectors, it is important for each division to establish an iterative PDCA cycle on its own in order to ensure the information security of the entire group. Therefore, each division conducts a self-audit every year to determine whether it conforms to the internal rules and endeavors to correct problems, if any.

The Cyber Security Center, which serves as a secretariat, assesses the results of the self-audit and improvement activities of each division and provides guidance and support if corrective action is required. Toshiba Group companies in Japan and abroad conduct a self-audit every year. The Cyber Security Center assesses its results from a third-party perspective to evaluate its validity so as to help enhance the information security level of each group company.

PDCA cycle based on a self-audit and assessment

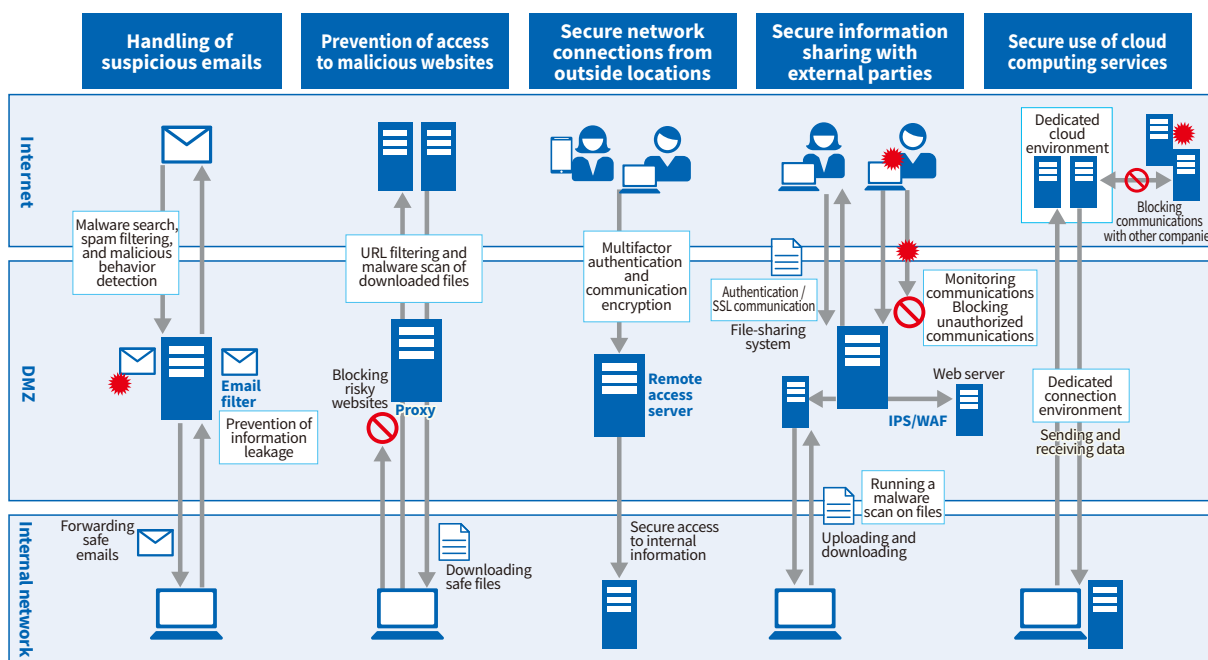

Self-audit and assessment conducted by the entire Toshiba Group

# Security Measures for Internet Connection Points

Toshiba Group observes tens of millions of attempted cyberattacks per day. To detect and block cyberattacks, Toshiba Group has security devices such as Web application firewalls (WAFs) and intrusion prevention systems (IPS) at the interface between internal and external networks. This section describes our countermeasures for various security risks implemented at the Internet connection points.

- DMZ (demilitarized zone): A subnetwork added between an organization's secure internal network and an untrusted external network such as the Internet
- Proxy: A computer system that acts as an intermediary for communications between the Internet and an internal network
- Intrusion prevention system (IPS): A device or software that detects and blocks an intrusion into an internal network
- Web application firewall (WAF): A form of firewall that detects and blocks cyberattacks attempting to exploit vulnerabilities of Web applications
- Spam: Unsolicited junk emails sent in bulk

## Handling of suspicious emails

Toshiba Group uses protective measures for both external cyber threats from virus-infected emails and internal threats of information leakage. To counter the inflow of harmful malware from an external environment, Toshiba Group employs behavior detection, sender domain authentication, and spam filtering to execute email attachments and email-embedded links in a safe environment. Consequently, Toshiba Group blocks hundreds of thousands of suspicious emails per day. In order to prevent information leakage from inside, Toshiba Group has implemented a tool to encrypt email attachments and prevent erroneous email transmissions, and has implemented email monitoring for external domains.

## Preventing access to malicious websites

Toshiba Group uses proxy servers to reduce the risk of accessing malicious websites on the Internet while employing a malware checker and a URL filter to prevent access to such websites. In the event of suspicious network activity, the computer concerned is identified from an access log. If access to particular websites is necessary for work purposes, it is permitted via user authentication so that access restrictions do not impede business.

## Secure network connections from outside locations

Toshiba Group provides salespersons and those on business trips with an environment that allows their PCs and smartphones to securely connect to the internal network via the Internet at hotel rooms and elsewhere. Multifactor authentication is used to prevent unauthorized access while all user communications are encrypted. In addition, virtual desktops are utilized for telework and working from home (WFH) as a means of promoting work style innovation.

## Secure information sharing with external parties

Toshiba Group makes the most use of websites to share and disseminate information to external parties. Access control and malware scanning allow us to securely exchange files with customers and suppliers. Our websites and servers that allows public access are subjected to periodic security assessment while security measures are promptly implemented to check for vulnerabilities and protect against increasing cyber threats.

## Secure use of cloud computing services

As cloud computing services are increasingly employed to improve work efficiency, the risk of information leakage, unauthorized access, and wrong settings increases. To alleviate this risk, Toshiba Group has established a secure private cloud environment in order to protect sensitive information from various threats. To use public cloud services, users are required to submit an application. We permit the use of public cloud services only when their security policy meets our requirements. Toshiba Group periodically checks whether there are any changes to the service features and methods used.

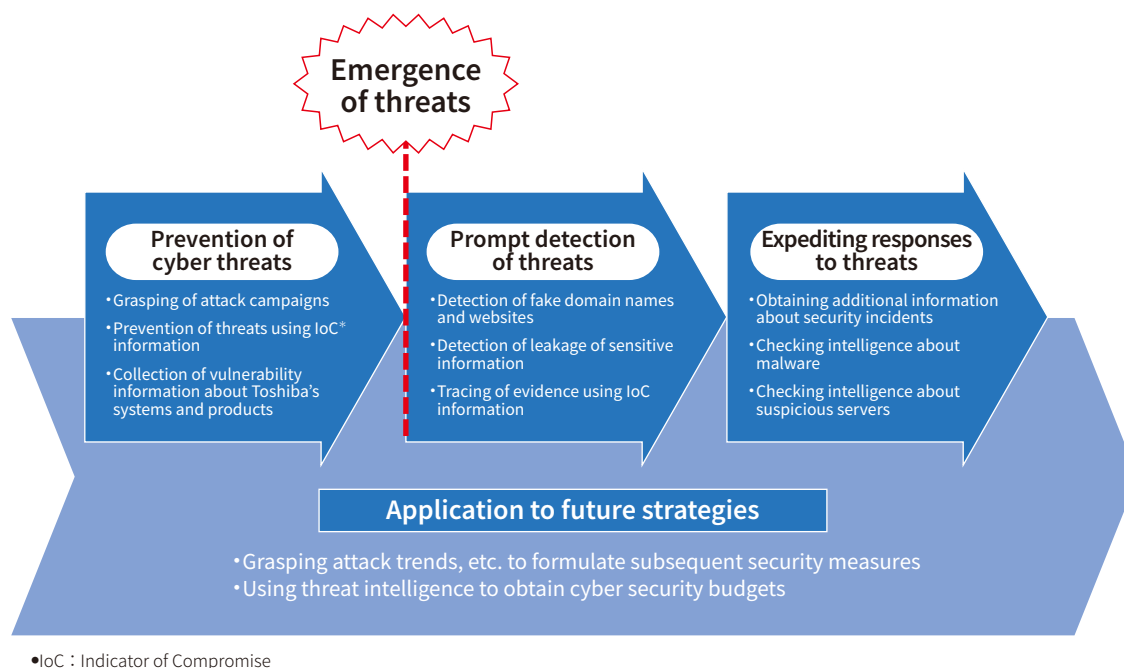

In addition to these common security measures, Toshiba Group keeps track of the settings of security devices and the network logs of the operating sites having their own Internet connection points. For protection from cyberattacks, Toshiba Group employs not only common measures but also additional measures according to the importance of business and information. At present, these measures are primarily designed for information systems. In the future, we will leverage such expertise to enhance the security of our factories and customer services.

## Utilization of Cyber Threat Intelligence

Toshiba Group actively utilizes cyber threat intelligence to enhance the sophistication of its security operations. Threat intelligence collectively refers to all types of intelligence data about attacks by hackers, trends in cyber threats, security vulnerabilities, etc. that can be used for the prevention and detection of cyber threats. Toshiba Group obtains cyber threat intelligence from various sources, including public organizations and external threat intelligence service providers.

We utilize such threat intelligence to prevent cyber threats to Toshiba Group and to promptly detect and respond to cyber threats if they materialize. We also use intelligence about cyberattack trends to formulate future security strategies.

# Security Measures for Products, Systems, and Services

Toshiba Group engages in various initiatives to enhance the security quality of its products, systems, and services offered to customers. In addition, Toshiba Group has established a product security incident response team (PSIRT) system to promptly respond to vulnerabilities found in its products in cooperation with external organizations.

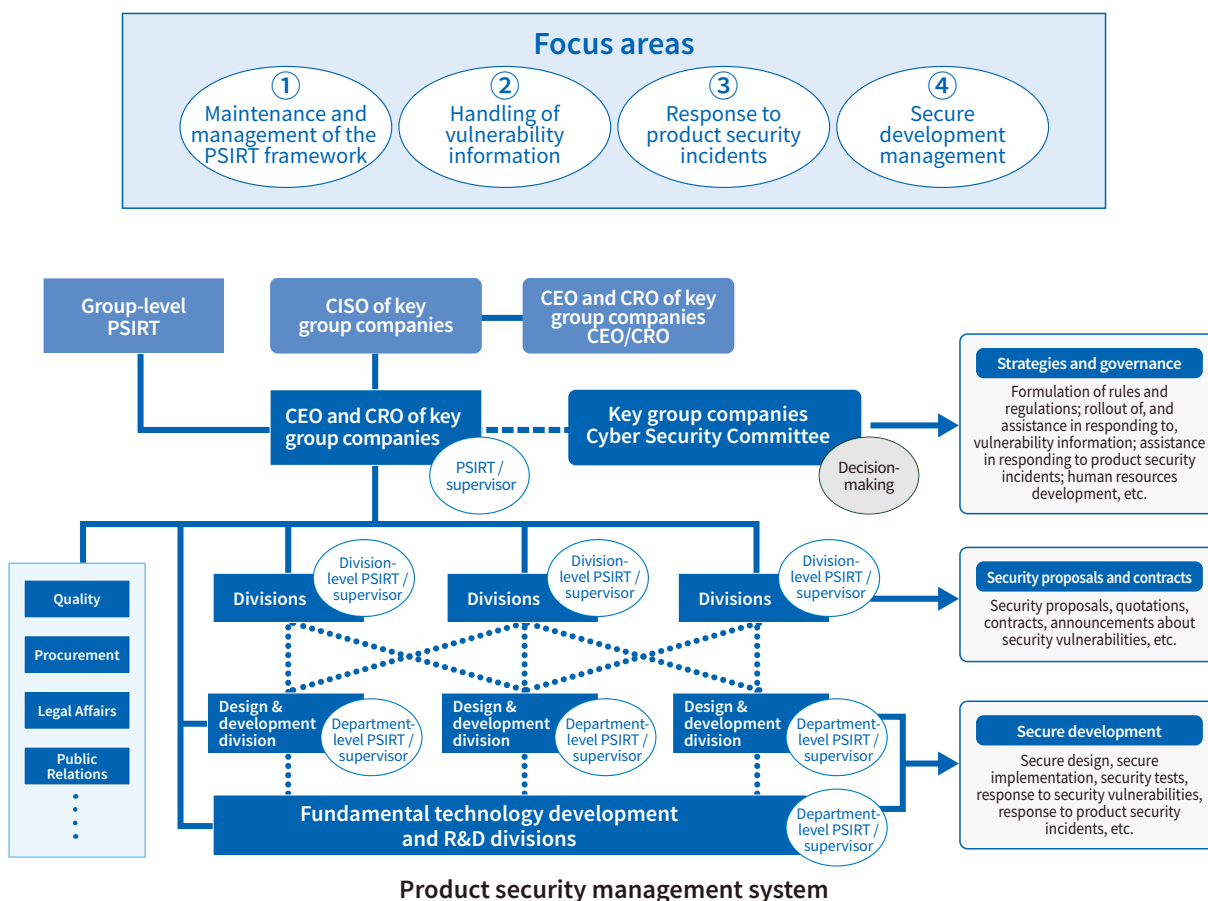

## Initiatives for Enhancing Product Security

In order to ensure the security of products, systems, and services offered to customers, Toshiba Group has established a product security management system as part of the cyber security management system. Under the product security management system, the PSIRT collaborates with quality assurance and procurement departments to enhance the security of product development processes as well as the security of third-party products for use in Toshiba Group's products.

### Devising plans to enhance product security preparedness

Toshiba Group defines four focus areas to strengthen its product security. Based on this definition, Toshiba Group has devised plans to enhance its product security preparedness according to risk-based priorities. Toshiba's product security management system covers all group companies. This product security management system makes it possible to effectively communicate group-wide measures to all business units and product design and development divisions of each group company while ensuring autonomous operations of each group company.

## Preparation of product security checklist, guidelines, and standard recommended tools

Toshiba Group is preparing product security checklists that summarize the security requirements to be checked at each product development stage as well as common guidelines and standard recommended tools for Toshiba Group corresponding to each of the checklists. They serve to remind product developers not to miss anything that should be considered in terms of security and help ensure consistent security responses regardless of differences in the experience, expertise, and proficiency of individual staff members. As part of the menu of evaluation/verification functions, Toshiba Group will provide the standard recommended tools and related support services that will come in handy when going through the checklists.

	Inquiry	Definition of requirements	Design & development	Manufacturing & testing	Implementation & inspection	Use	Disposal
<b>Product security checklist</b>	<ul style="list-style-type: none"> <li>• Requirements for procurement</li> <li>• Applicability of laws and regulations</li> <li>• Risks</li> </ul>	<ul style="list-style-type: none"> <li>• Analysis of potential cyber threats and consideration of countermeasures</li> </ul>	<ul style="list-style-type: none"> <li>• Network control</li> <li>• Known vulnerabilities</li> </ul>	<ul style="list-style-type: none"> <li>• Source code vulnerabilities</li> <li>• Vulnerability test</li> </ul>	<ul style="list-style-type: none"> <li>• Product safety</li> <li>• Go/no-go criteria for shipment</li> </ul>	<ul style="list-style-type: none"> <li>• Collection of vulnerability information</li> <li>• System management and agreement with customers</li> </ul>	<ul style="list-style-type: none"> <li>• Notification of potential information leakage risk when a product is disposed of or transferred to another party</li> </ul>
<b>Guidelines</b>	<div>Guidelines for use of product security checklist</div> <ul style="list-style-type: none"> <li>• Procedures</li> <li>• Common guidelines</li> <li>• Expertise</li> <li>• Know-how</li> </ul>						
<b>Standard tools recommended</b>	<ul style="list-style-type: none"> <li>• Evaluation and verification functions</li> <li>• Support functions</li> </ul>						

## Establishment of the Toshiba Product Security Quality Assurance Guidelines for Suppliers (Software Edition)

Toshiba Group is now preparing a product security guide to help suppliers understand its views on product security and to solicit their cooperation in the realization of secure products, systems, and services. This guide summarizes specific security requirements for suppliers in three areas: 1) supplier's security management system, 2) deliverables of software development, and 3) operation services to be contracted out. To communicate our security requirements, Toshiba Group provides suppliers with this guide before entering into business relations with them.

**Toshiba Product Security Quality Assurance Guidelines for Suppliers (Software Edition)**

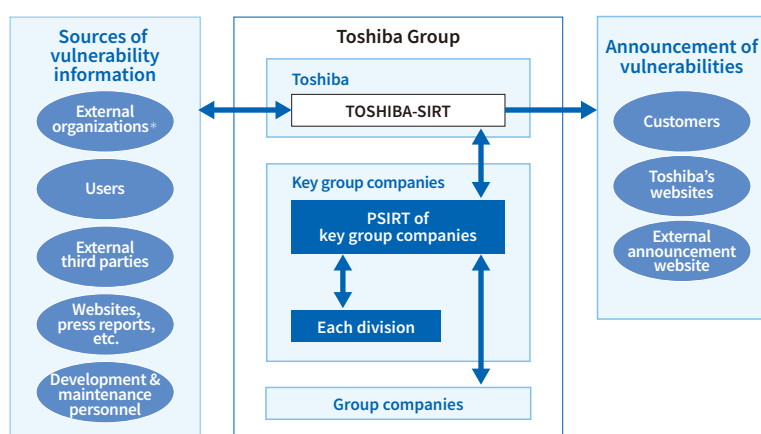

# Prompt and Reliable Response to Security Vulnerabilities

Toshiba Group has a product vulnerability response system in place to provide a prompt and consistent response to vulnerability information, contributing to reducing the business risk of customers using its products, systems, and services. As a member of the Information Security Early Warning Partnership established as per the Standards for Handling Software Vulnerability Information and Others, a directive of the Ministry of Economy, Trade and Industry (METI) of Japan, Toshiba Group actively collects vulnerability information in cooperation with external organizations. In addition, Toshiba Group has established the Product Security Risk Handling Manual, in-house regulations that describe specific procedures for handling vulnerability information so that vulnerability information is dealt with in a consistent manner across Toshiba Group. We also provide all employees with an e-learning program to raise their awareness of security throughout the product life cycle.

## Vulnerability handling system

The TOSHIBA-SIRT is responsible for handling information about the vulnerabilities of the products, systems, and services offered by Toshiba Group. The TOSHIBA-SIRT serves as a sole channel of contact for internal and external parties regarding the handling of vulnerability information. The TOSHIBA-SIRT provides prompt and consistent responses to vulnerability information in cooperation with the PSIRT of key group companies of the Group. If any vulnerability could have a severe impact on customers' businesses, Toshiba Group announces and deals with the vulnerability in an appropriate manner, taking social impact into consideration.

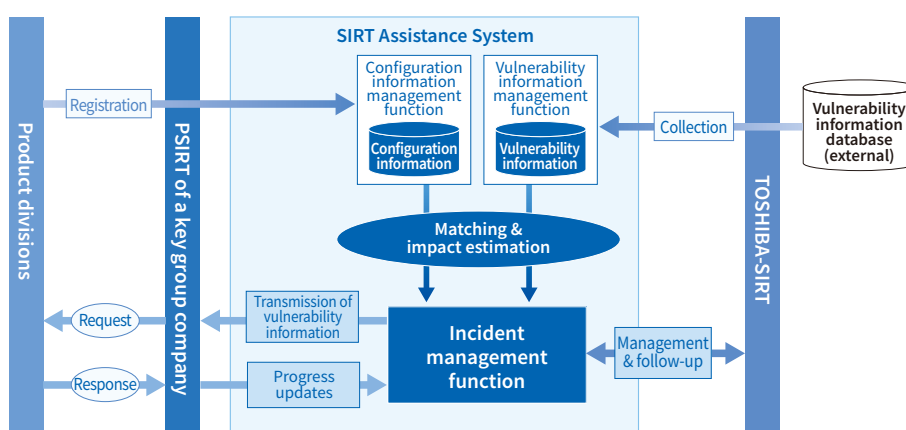

\* External organizations: JPCERT/CC, JVN, ICS-CERT, etc

**Toshiba Group's vulnerability handling system**

## Vulnerability handling process

When vulnerability information is received from an external source, the key group company concerned needs to identify the affected products, determine the level of impact, and accordingly take necessary action. To cope with ever-increasing product vulnerabilities, Toshiba Group has developed the SIRT Assistance System, leveraging its expertise in vulnerability handling. Product divisions utilize this system with the aim of providing prompt and reliable handling of vulnerability information.

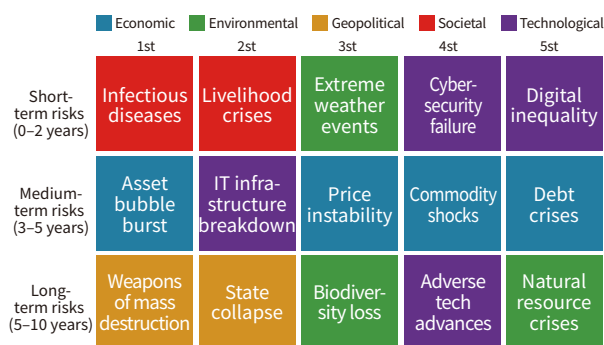

**Summary of the SIRT support system**

## Column

### Cyber security measures for supply chains

The COVID-19 pandemic has imposed unprecedented restrictions on both business activity and individual movement. Even in the midst of the pandemic, we have overcome the inconvenience in everyday life by using various IT technologies. However, the increased use of IT devices exposes us to ever-higher levels of cyber security risks.

According to The Global Risks Report 2021<sup>\*1</sup> released by the World Economic Forum in January this year, cybersecurity failure ranks fourth among short-term risks (0–2 years), with respondents to the survey forecasting it will become a critical threat to the world<sup>\*2</sup>.

Global Risks Horizon

When do respondents forecast risks will become a critical threat to the world?

Source: World Economic Forum, The Global Risks Report 2021

### Cyberattacks targeting supply chains

Nowadays, the number of cyberattacks targeting weaknesses in supply chains<sup>\*3</sup> is increasing. In June 2020, the Ministry of Economy, Trade and Industry (METI) of Japan issued a news release entitled “Report on the Recognition of Recent Circumstances Surrounding Industries in relation to Cybersecurity and Directions of Future Efforts Compiled,” warning enterprises of all sizes of the pressing need to enhance cyber security<sup>\*4</sup>. This trend is not limited to Japan. The European Union (EU) announced a new Cybersecurity Strategy<sup>\*5</sup>, stating the need to address the security of supply chains as one of the priorities to increase the level of cyber resilience. Supply chain security is increasingly recognized as one of the major policy concerns worldwide.

For example, an attacker seeking a weakness in a supply chain tries to intrude into a business entity related to the real target of an attack first. Therefore, overseas operating sites, group companies, subsidiaries, and suppliers can be targeted as stepping stones to a bigger target. It is therefore not enough for one’s own organization or headquarters to adopt cyber security measures. Of greater importance is how each individual raises security awareness and enhances the security of all processes related to a supply chain.

\*1 [http://www3.weforum.org/docs/WEF\\_The\\_Global\\_Risks\\_Report\\_2021.pdf](http://www3.weforum.org/docs/WEF_The_Global_Risks_Report_2021.pdf)

\*2 A supply chain is a sequence of processes from the production of parts and materials for a given product to the distribution of the product to the final consumer

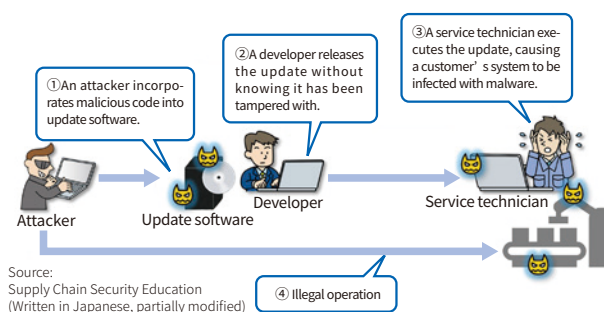

\*3 [https://www.meti.go.jp/english/press/2020/pdf/0612\\_001a.pdf](https://www.meti.go.jp/english/press/2020/pdf/0612_001a.pdf)

\*4 [https://ec.europa.eu/commission/presscorner/detail/en/IP\\_20\\_2391](https://ec.europa.eu/commission/presscorner/detail/en/IP_20_2391)

### Toshiba Group’s initiative

Toshiba Group actively provides e-learning programs “Supply Chain Security Education” (Written in Japanese) for all employees so that they can be prepared for product security risks present in supply chains and learn about not only potential security threats in supply chains but also how to protect against possible risks. Many businesses are both buyers (contractors) and suppliers (subcontractors), which are roles subject to different risks. It is therefore important to recognize different types of risks and implement countermeasures according to the risks involved. In addition to e-learning programs, Toshiba Group provides specific regulations and guidelines for product security. They define the rules for checking with customers/suppliers about security requirements, quantifying the security levels of suppliers to help raise their security awareness, and selecting suppliers accordingly.

Through these activities, Toshiba Group endeavors to enhance the overall security of supply chains.

Example of a cyberattack against a supply chain (Malware infection via update software)

# Offering of Secure Products, Systems, and Services

To meet the security requirements in the fields of energy, social infrastructure, electronic devices, etc., Toshiba Group provides various products, systems, and services for cyber security.

## Unidirectional gateways: TOSMAP-DS™/LX OWB

Toshiba Energy Systems & Solutions Corporation

With the recent liberalization of the electricity market, the monitoring and control systems for power plants are becoming increasingly diverse, driving the need for efficient and advanced monitoring. For example, there is an increasing need for integrated remote monitoring and sophisticated analysis using operational data of power plants. To meet this need, it is necessary to fully protect the monitoring and control functions of power plants while sending data to external sites. Against this background, Toshiba Energy Systems & Solutions Corporation has developed the TOSMAP-DS™/LXOWB unidirectional gateways that secure the network inside power plants. To protect the internal network, the TOSMAP-DS™/LXOWB physically blocks communications from the external world while allowing unidirectional data transmissions to the external world. Therefore, the TOSMAP-DS™/LXOWB provides robust network security. The TOSMAP-DS™/LXOWB consists of a pair of separate transmitter (TX) and receiver (RX) units, with the TX unit having only a light-emitting device and the RX unit equipped only with a light-receiving device. This configuration clearly defines the network security boundary, physically allowing data to be transmitted in one direction only. The TOSMAP-DS™/LXOWB is designed in such manner that it can easily be added to an existing control system of a power plant to achieve advanced secure monitoring of its operation. With Achilles Communication Certification Level 2, the TOSMAP-DS™/LXOWB provides superior robustness\* capable of detecting unknown security vulnerabilities. As a successor, we have also released the TOSMAP-DS™/LXOWR that is smaller and provides higher performance than the TOSMAP-DS™/LXOWB.

\*Robustness: the property of being strong and unlikely to be affected by external

## Industrial controller certified to ISASecure® EDSA<sup>\*1</sup>: Unified Controller nv series type2

Toshiba Infrastructure Systems &  
Solutions Corporation

As cyberattacks against critical infrastructure become prevalent, the security measures and management of mission-critical control systems are becoming increasingly important. The Unified Controller nv series from Toshiba Infrastructure Systems & Solutions Corporation is widely used for social infrastructure and industrial applications. The type2 is a secure control system incorporating various security functions that is specifically designed for use in Toshiba's CIEMAC™-DS/nv instrumentation control system for general industrial applications.

ISASecure® EDSA is a security certification program for embedded control systems operated by ISCI<sup>\*2</sup> in the United States as a scheme owner. The EDSA certification is increasingly required by enterprises as one of the procurement conditions. As the ISASecure® EDSA certification is expected to be integrated into the IEC 62443 series, it is attracting a lot of attention from various industries. The EDSA certification consists of three elements: Software Development Security Assessment (SDSA), Functional Security Assessment (FSA), and Communication Robustness Testing (CRT). The Unified Controller nv series type2 received an EDSA certificate from CSSC<sup>\*3</sup>, an internationally recognized third-party certification laboratory.

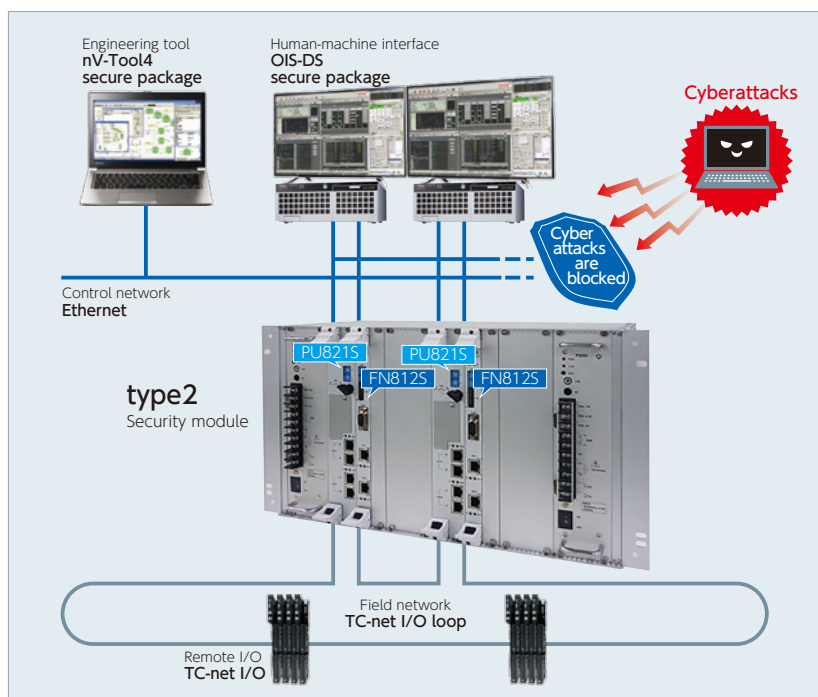

The security module of the Unified Controller nv series type2 provides functions such as encryption of communication channels, control data, and parameters as well as authentication. These security functions provide robust protection against external cyberattacks during control operations while maintaining communication links with an engineering tool and a human-machine interface.

The Unified Controller nv series type2 makes it possible to securely configure the CIEMAC™-DS/nv instrumentation control system.

With the advent of the IoT era, the functions and roles expected of control systems and components are increasing. Therefore, construction of safe and secure systems is becoming increasingly important. We will continue to expand our portfolio of secure and highly reliable products in order to contribute to the realization of a safe, secure, reliable, and sustainable society.

Unified Controller nv series type2

Example of control system configuration

\*2 ISA Security Compliance Institute: An organization founded by a consortium of ISA members to provide EDSA certification

\*3 CSSC: Control System Security Center

## Implementation of security features in storage products

Toshiba Electronic Devices & Storage Corporation

Accompanying the growing demand for personal data protection, the importance of information security of storage products is increasing. Toshiba Electronic Devices & Storage Corporation provides hard disk drives (HDDs) suitable for various applications, including client HDDs for personal mobile devices and multifunction printers (MFPs), and enterprise HDDs for data centers. Our HDDs incorporate adequate security features according to their intended applications.

Security requirements for HDDs include prevention of data leakage in the event of theft or loss. A function for wiping out all data is also required for HDDs to prevent data leakage after disposal. To meet these requirements, we develop self-encrypting drives (SEDs).

The MQ01ABU\*\*\*BW series\*<sup>1</sup> automatically encrypts the written data internally using AES\*<sup>2</sup>, a standard encryption algorithm specified by the U.S. National Institute of Standards and Technology (NIST). The MQ01ABU\*\*\*BW series also supports access control using the ATA\*<sup>3</sup> Security Feature Set and TCG\*<sup>4</sup> Opal SSC\*<sup>5</sup> to prevent retrieval of protected data without password authentication. These features provide data leakage protection.

Furthermore, the MQ01ABU\*\*\*BW series incorporates Cryptographic Erase that allows the user to instantaneously invalidate all data in the drive simply by changing a data encryption key as well as Wipe technology, our proprietary data encryption technology to wipe out all data without a costly overwriting process. The security level of the MQ01ABU\*\*\*BW series is certified through an accredited third party under the Cryptographic Module Validation Program (CMVP) (#2082) for use by the U.S government and under JCMVP (Japan CMVP) (#F0022) for use by the Japanese government. These certifications are security requirements for self-encrypting HDDs for digital MFPs and therefore simplify a digital MFP vendor's acquisition of security certification.

# The CyberX platform, a cyber security platform for control systems

Toshiba Digital Solutions Corporation

Previously, control systems for social infrastructure were isolated from external networks. However, as digitization expands to a wide range of industrial and social sectors, they are becoming increasingly connected to IoT networks, exposing energy, manufacturing, transportation, healthcare, and other critical infrastructure installations to ever-increasing security risks. It is difficult, however, for these infrastructure industries to identify potential risks in their systems and networks accurately. CyberX (Defender for IoT), which is utilized for control systems at more than 3,000 infrastructure installations around the world, helps solve these issues. As a distributor in Japan, Toshiba Digital Solutions Corporation provides one-stop services, encompassing optimal system architecting, installation, operations support, and maintenance, by leveraging its wide-ranging expertise in social infrastructure and facility management.

Features of the CyberX platform include the following:

1. Analyzing network traffic through identification and visualization of assets to learn information assets, detect devices on a network automatically, and display a network topology map (i.e., network interconnections) in real time
2. Collecting and analyzing information as necessary to automatically generate a list of assets and a summary report on device and network vulnerabilities in a system as well as possible countermeasures for each of the detected vulnerabilities
3. Detecting security threats to and abnormal conditions of a control system as per the control protocol and assisting in the analysis of security incidents to enable prompt operations
4. Identifying the conditions of an entire control system to predict existing dangerous attack paths based on the information about the vulnerability of all assets so as to support the formulation of countermeasures

•CyberX (Defender for IoT) is a product from Microsoft Corporation.

## Quantum Key Distribution System

Toshiba Digital Solutions Corporation

Nowadays, information and communication networks represented by the Internet are essential in everyday life. With the ever-increasing spread of IoT, we will become more dependent on networks.

On the other hand, the progress of quantum computers is remarkable. Large quantum computers will appear at some point in the future. Because of their overwhelming computing power, quantum computers will be able to break modern encryption schemes that are widely used in the Internet, exposing computer networks to a greater risk of information leakage.

Quantum key distribution is a technology to combat such a risk. Quantum key distribution is theoretically unbreakable no matter how fast quantum computers run. It uses a single photon, an elementary particle of light, to distribute quantum keys for encryption in order to prevent eavesdropping by virtue of the principles of quantum mechanics.

Toshiba Group has been leading research on quantum key distribution for more than 20 years, setting a new record for the key rate (i.e., the number of quantum keys sent per unit of time).

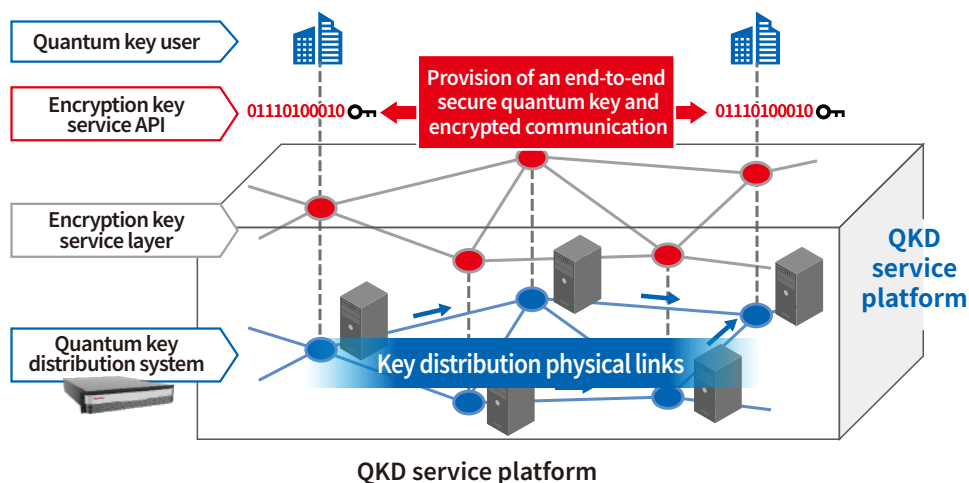

Our quantum key distribution system will ensure secure quantum keys into the future. We have now commenced its provision for proof-of-concept (PoC) purposes. Secure quantum keys can easily be used via a standardized application programming interface (API)\*.

Our next step is to deploy this system on large networks to provide quantum key distribution services for many customers in various fields.

\* ETSI GS QKD 014

Quantum key distribution system

Payment and settlement methods are becoming diverse. Payment by credit card is one of the most widely used methods of payment. For credit card payment transactions, clients' sensitive information is transmitted, including a credit card number and personal information. Should any of the sensitive information be intercepted and misused, credit card users would suffer serious damage. Therefore, the Japanese government designates credit card settlement services as one of the 14 critical infrastructure sectors that could have a significant impact on people's lives. Before the Payment Card Industry Security Standards Council (PCI SSC) was established in 2006 by five international payment brands to develop security standards, card settlement terminals had been manufactured according to manufacturers' individual standards. One of the security standards developed by the PCI SSC is PCI PTS (Payment Card Industry PIN Transaction Security), which is the highest security certification for card settlement terminals that require a PIN (personal identification number) to work.

The PADCT-5100 PIN pad for the CT-5100 card settlement terminal series is certified as conforming to PCI PTS 4.1 for secure PIN entry. PCI PTS specifies a wide range of requirements, including those for security functions of the software and hardware comprising a card settlement terminal as well as product management.

In addition, the CT-5100 uses a closed operating system (OS) instead of an open OS such as Android and Linux. All the embedded software modules incorporate authentication and encryption functions, making the CT-5100 robust against external hacking attacks. Its tamper-resistant function provides protection against external malicious attacks, allowing merchants to use the CT-5100 without security concerns.

The revision of the Installment Sales Act of Japan that came into effect in June 2018. This revision obligates credit card merchants to strengthen the security measures for credit card transactions. It also requires merchants that handle in-store credit card transactions not to retain credit card information (or to achieve a state equivalent to a non-retaining state) or otherwise to comply with PCI DSS. There are two methods for not retaining credit card information. One method allows card information to be processed by credit card companies without passing through in-store POS terminals and networks. The other method allows card information to pass through in-store POS terminals and networks, but uses an encryption scheme to make it impossible for merchants to access card numbers and decrypt them. The CT-5100 and PADCT-5100 support both methods.

Left : CT-5100 (main unit)  
Right : PADCT-5100 (PIN pad with IC card reader/writer)

## R&D

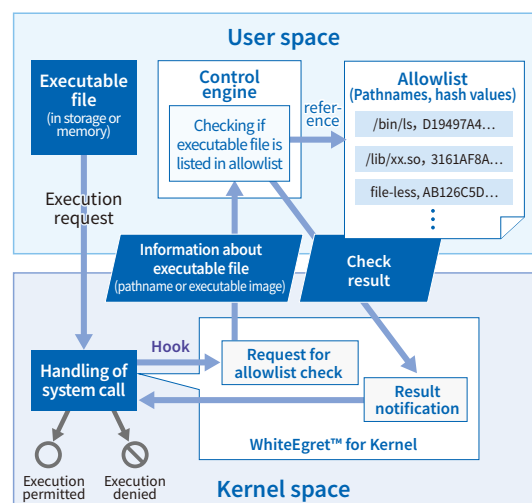

To protect social infrastructure from increasingly sophisticated and diverse cyberattacks, Toshiba is engaged in R&D on cutting-edge security management technologies as well as advanced cyberattacks and data encryption to support such security management. Toshiba strives to stay ahead of evolving cyber security threats by means of proactive operation in order to continue delivering Toshiba-standard safety and security quality cultivated through its experience in the social infrastructure business.

### Malware execution control

Nowadays, malware targets control systems for critical infrastructure such as electric power systems, threatening the foundations of society.

In response, Toshiba has developed WhiteEgret™, an allowlisting malware execution control technology to determine whether to invoke an executable using a standard Linux® interface. WhiteEgret™ makes it possible to protect control systems from both known and unknown malware. In addition, WhiteEgret™ incorporates container-based virtualization technology that is increasingly used for control systems and provides protection from new file-less malware.

Reference: HARUKI Hiroyoshi, et al. "Cybersecurity Technologies Ensuring Safe, Secure, and Long-Term Operation of Control Systems for Infrastructure."  
Toshiba Review 73(5), September 2018

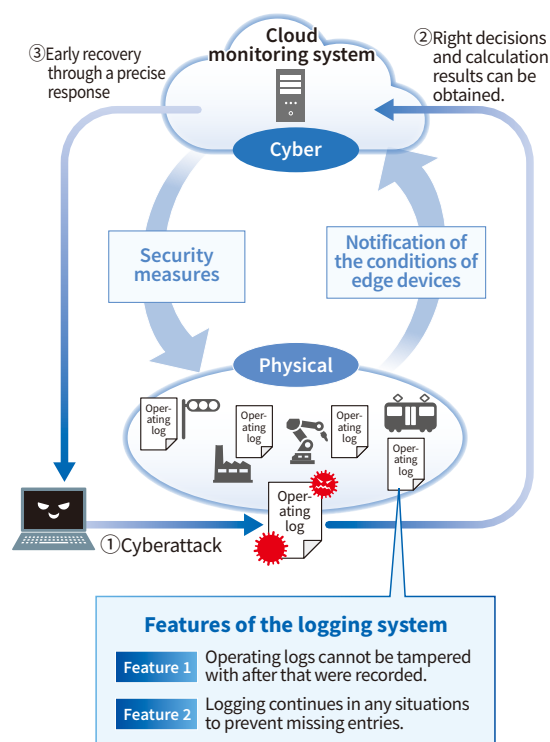

### Embedded logging system

Stable operation is required for social infrastructure systems over the long term. In order to detect abnormal behaviors and signs of failure, they are monitored remotely via the cloud using operating logs gathered from edge devices. In the event of a successful cyberattack against a social infrastructure system, the attacker might tamper with an operating log, making it impossible to grasp system conditions correctly and consequently leading to an accident.

To prevent such a situation, Toshiba has developed a logging system for edge devices using virtualization technology that is robust against the tampering with or missing entries from an operating log due to a cyberattack.

Reference: JIANG Dan, et al. "Proposal for a Secure Logging System for Embedded Systems." SCIS2020 (in Japanese)

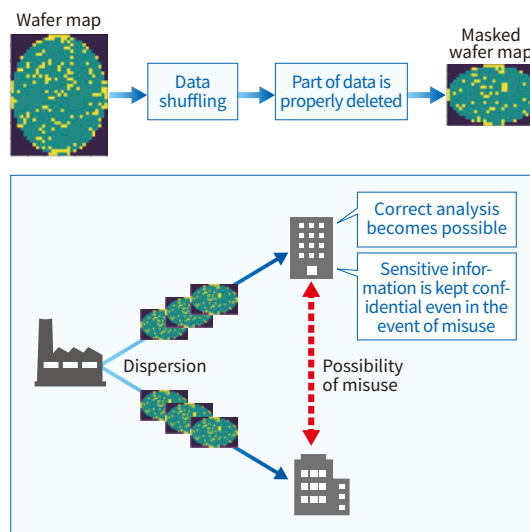

## Data processing technology combining security and usefulness

Productivity improvement and other benefits can be obtained by properly analyzing and using industrial data such as wafer maps\* in semiconductor manufacturing. However, furnishing external parties with such data to achieve full data utilization increases the risk of leakage of sensitive information contained in industrial data. Conversely, use of an encryption or other security technology makes it difficult to perform an analysis with a high degree of flexibility.

To resolve this dilemma, Toshiba has developed data masking technologies to ensure both security and analyzability.

These technologies are capable of protecting sensitive information by properly shuffling and deleting data, making data misuse impossible.

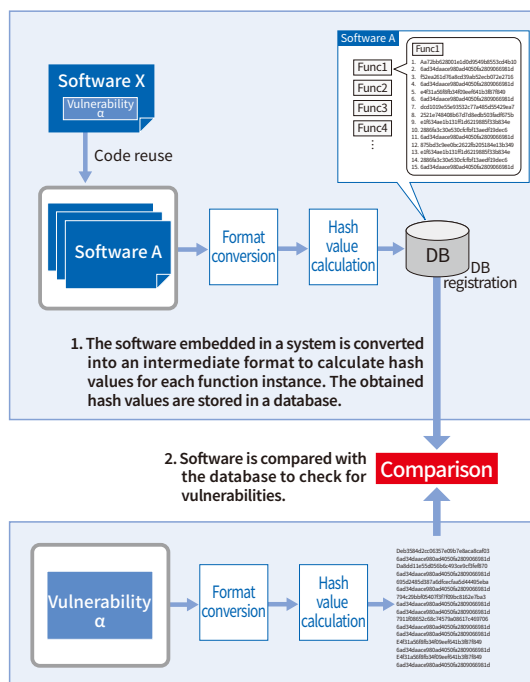

\*Wafer map: Data showing the distribution of non-defective and defective chips on a silicon wafer

Reference: WADA Hiroho, et al. "Initial Study on Secure and Analyzable Data Masking Methods for Wafer Map." SCIS2020 (in Japanese)

## Vulnerability detection technology

Software vulnerabilities can be exploited by cyberattacks as an entry point to gain access into an organization's network and inflict substantial damage on its computer systems. It is therefore crucial to identify all vulnerabilities. Nowadays, however, software developers do not often possess source code since externally provided software is widely used.

Toshiba has developed vulnerability detection technology for binary code. Since the build and execute environment cannot be inferred from input binary images, the technology converts binary images back into environment-independent commonalized code in order to enable an analysis. Even if an externally provided binary code contains a vulnerability, it can be detected using this technology.

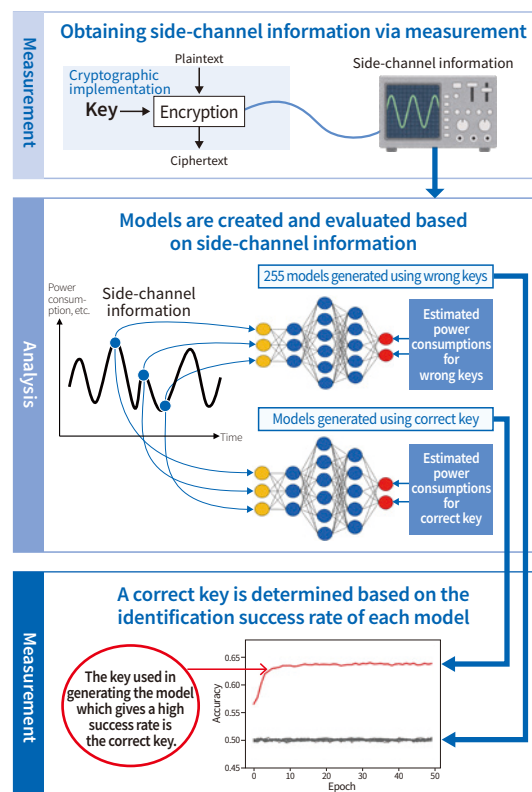

Reference: FUJIMATSU Yurie, et al. "Evaluation of Binary Similarity Analysis Tool "VulneraBin" for Scalable Vulnerability Detection." SCIS2021 (in Japanese).

## Cyberattack evaluation technology

Social infrastructure systems (cyber-physical systems) connected with myriad devices, are exposed to increasingly sophisticated and diverse cyber threats. To protect social infrastructure systems from such cyber threats, it is necessary to understand the available attack technologies. Hence Toshiba has developed a technology to physically analyze the components comprising a CPS and incorporated it into its development process for product evaluation. Toshiba is also developing a tamper-proof implementation technology based on the latest attack technologies such as AI-based side-channel attacks.

Reference: MAEDA Tomonori, et al. "Hyperparameters and Efficient Methodology of Non-Profiled Deep Learning-Based Side Channel Attacks." SCIS2021 (in Japanese).

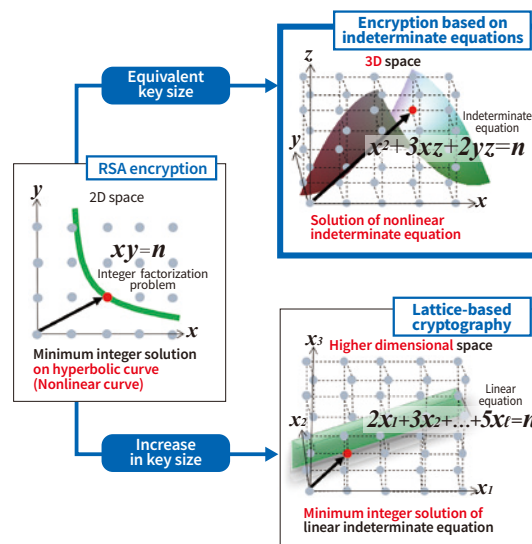

## Quantum computing-resistant cryptography

Quantum computers capable of processing large integers are expected to have the ability to break the widely used public key cryptography.

In response, Toshiba has developed an encryption scheme whose security depends on the problem of solving a non-linear indeterminate equation problem that is much harder than integer factorization problem used in the current RSA algorithm. By using the hard problem, we aim to achieve an encryption scheme with a key length as short as or shorter than RSA keys. We intend to apply public key cryptosystems to edge devices with limited resources.

Reference: AKIYAMA Koichiro et al. "A Public-key Encryption Scheme Based on Non-linear Indeterminate Equations (Giophantus)," <https://eprint.iacr.org/2017/1241>, 2017

# Personal data protection

---

Toshiba Group protects personal data obtained from its stakeholders in the course of business activities appropriately, recognizing that personal data is an important asset of each stakeholder and also an important asset for Toshiba, leading to creation of new value.

## Establishment of in-house regulations and a management system, and education

---

To properly manage and handle personal data, Toshiba has established the Toshiba Personal Data Protection Program. Its group companies have also established similar programs. To observe and implement the rules defined in the regulations, the cyber security management system composed of all divisions of the company is promoting personal data protection (see page 10). Toshiba also educates all officers, regular employees, and temporary staff every year about the handling of personal data and safety management practices.

## Identification and management of personal data

---

To identify personal data owned by each organization, Toshiba maintains and periodically checks updates its personal data management database. We assess the risks involved based on the contents and volume of personal data and manage them accordingly. We also perform first-hand inspections of the divisions and group companies that handle high-risk personal data and take corrective action if any improvements are required.

## Selection and supervision of outsourcees entrusted with the handling of personal data

---

When the handling of personal data is contracted out, the outsourcer will be held responsible for inadequate supervision of the outsourcee in the event of leakage of any personal data. After cases of data leakage from outsourcees were reported in the press, protection of personal data became a social issue. Outsourcers are now required to supervise outsourcees. Toshiba Group stipulates the rules and guidelines for the selection of outsourcees so that only those capable of properly safeguarding personal data will be selected. Toshiba Group periodically ensures that personal data are properly managed and handled by outsourcees.

# Compliance with overseas laws and regulations

---

In recent years, many countries have enacted or revised legislation on personal data protection. In Toshiba Group, regional headquarters in the United States, China, Europe, and Asia are spearheading compliance activities according to the business risks involved.

## Compliance with the General Data Protection Regulation (GDPR)

---

In order to comply with the EU GDPR, Toshiba's regional headquarters in Europe and other Toshiba Group companies implement various measures, including employee education, establishment of in-house regulations, and data mapping. Toshiba Group is also educating all employees of Japanese group companies about an overview of the GDPR and the transfer of personal data out of Europe. Following the withdrawal of the United Kingdom from the EU, the transition period ended at the end of December 2020. Prior to the end of the transition period, European subsidiaries and Japanese group companies of Toshiba Group concluded the Toshiba Intra-Group Data Sharing Agreement (IGDSA) in October 2020 in order to establish a contractual basis for the cross-border sharing of personal data.

## Compliance with the China Cyber Security Law

---

Bylaws and guidelines for the China Internet Security Law, which came into effect in June 2017, have been established. As a result, law enforcement concerning illegal acts is now becoming common. In response, Toshiba's regional representative subsidiaries in China are collecting information so as to comply with the related laws and regulations.

## Compliance with Thailand's Personal Data Protection Act (PDPA)

---

Thailand promulgated PDPA in May 2019. To ensure that local subsidiaries comply with PDPA, Toshiba has created templates for in-house regulations concerning PDPA and provided it for the local subsidiaries.

Toshiba Group participates in various standardization and other external activities concerning cyber security so as to help realize a secure cyber-physical society.

## International standardization activities

Major de jure international standardization bodies include the International Organization for Standardization (ISO) and the International Electrotechnical Commission (IEC). Together, the ISO and the IEC form a joint technical committee called ISO/IEC JTC 1 (Joint Technical Committee 1). Toshiba Group is a member of three subcommittees (SCs) of ISO/IEC JTC 1, participating in the following standardization activities:

- ISO/IEC JTC1/SC17 Cards and security devices for personal identification
- ISO/IEC JTC1/SC27 Information security, cybersecurity and privacy protection
- ISO/IEC JTC1/SC41 Internet of things and digital twin
- ISO TC292/WG4: Authenticity, integrity and trust for products and documents
- IEC TC65/WG10: Industrial-process measurement, control and automation
- ETSI SCP (European Telecommunications Standards Institute Smart Card Platform):  
Activities for standardization for European telecommunications
- GlobalPlatform: Technology for the management of multi-application IC cards

## SIRT activities

### FIRST

The Forum of Incident Response and Security Teams (FIRST) is an international community formed through relationships of trust, consisting of universities, research institutes, enterprises, and government bodies. Toshiba Group joined the FIRST in January 2019.

### Nippon CSIRT Association (NCA)

The Nippon CSIRT Association (NCA) is a Japanese organization that handles computer security incidents. Toshiba Group joined the NCA in 2014.

## Other activities

Toshiba Group participates in various external activities for exchanging information about, and promoting dissemination of, cyber security. Toshiba Group also delivers presentations at seminars and academic conferences held in Japan.

- Information-technology Promotion Agency, Japan (IPA), 10 Major Security Threats Authors' Association, etc.
- Japan Electric Measuring Instruments Manufacturers' Association (JEMIMA)
- Japan Electronics and Information Technology Industries Association (JEITA),
- Communications and Information network Association of Japan (CIAJ),  
ICT Network Equipment Security Committee, etc.
- JIPDEC
- Japan Information Security Audit Association (JASA)
- Initiative for Cyber Security Information Sharing & Partnership of Japan (J-CSIP),  
Critical infrastructure equipment manufacturing company Special Interest Group
- Electronic Commerce Security Technology Research Association (ECSEC)
- Control System Security Center (CSSC)
- Robot Revolution & Industrial IoT Initiative, Industrial Security Action Group
- Industry Cross-Sectoral Committee for Cybersecurity Human Resources Development
- Cybersecurity Council of the National center of Incident readiness and Strategy for Cybersecurity (NISC)
- Technical member of the Japan Electricity Information Sharing and Analysis Center (JE-ISAC)
- Japan Digital Trust Forum (JDTF)

etc.

# Third-Party Assessment and Certification

As of March 31, 2021

Toshiba Group promotes the utilization of third-party assessment and the acquisition of certification concerning information security management, personal data protection, and products.

## Acquisition of the Information Security Management System (ISMS) certification

Toshiba IT-Services Corporation  
Toshiba Information Systems Corporation  
Toshiba Infrastructure Systems & Solutions Corporation (SA Division at Komukai Complex)  
Toshiba Information Systems (Japan) Corporation  
Toshiba Digital Solutions Corporation  
Toshiba Digital Marketing Initiative Corporation  
(Server Service Group and Application Service Group, Web Platform Department, Solutions Division)  
Toshiba Digital Marketing Initiative Corporation, Toshiba Business Expert Corporation  
Business Support Department, TBLS Business Division and Shiba Daimon Juku,  
Human Resource Development Department  
Toshiba Digital & Consulting Corporation  
Toshiba Tec Corporation (Shizuoka Business Center (Mishima))  
Toshiba Tec Corporation (Shizuoka Business Center (Ohito))  
Toshiba TEC Solution Services Corporation  
Toshiba Development & Engineering Corporation  
Toshiba Lifestyle Products & Services Corporation  
Japan Systems Corporation  
TEC Information Systems Corporation  
Enterprise Business System Solutions Corporation  
SBS Toshiba Logistics Corporation  
Kyushu Toshiba Engineering Corporation (Headquarters)  
Chubu Toshiba Engineering Corporation (Headquarters, Yokohama Complex)

## Acquisition of the PrivacyMark certification

Kyushu Toshiba Engineering Corporation  
Toshiba I.S. Consulting Corporation  
Toshiba IT-Services Corporation  
Toshiba Information Systems Corporation  
Toshiba Infrastructure Systems & Solutions Corporation  
Toshiba Health Insurance Association  
Toshiba Automation Systems Service Co., Ltd.  
Toshiba Information Systems (Japan) Corporation  
Toshiba Digital Solutions Corporation  
Toshiba Digital Marketing Initiative Corporation  
Toshiba TEC Solution Services Corporation  
Toshiba Business Expert Corporation  
Toshiba Plant Systems & Services Corporation  
Mizuho-Toshiba Leasing Company, Limited  
UT Toshiba Co., Ltd.

## Acquisition of IT security evaluation and certification

The following table lists major products certified under the Japan Information Technology Security Evaluation and Certification Scheme (JISEC) based on ISO/IEC 15408\*<sup>1</sup> that is operated by the Information-technology Promotion Agency, Japan (IPA) and those certified under certification schemes in other countries (as of March 2021).

Product	TOE * <sup>2</sup> Class	Certification Number	PP and EAL
TOSHIBA e-STUDIO330AC/400AC Model SYS V1.0 with a fax unit and a FIPS hard disk kit	Digital MFP	C0684	PP conformance (Protection Profile for Hardcopy Devices 1.0 dated September 10, 2015)

\*<sup>1</sup> ISO/IEC 15408: An international standard for the evaluation of products and systems related to information technology to determine whether they are properly designed and implemented in terms of information security

\*<sup>2</sup> TOE (Target of Evaluation): Software and hardware products to be evaluated TOE sometimes includes user's manuals, guides, installation procedures, and other documents written for administrators and users.

\*<sup>3</sup> EAL (Evaluation Assurance Level): Numerical rating as per ISO/IEC 15408 describing the depth and rigor of an evaluation. There are seven levels from EAL 1 to EAL 7, with EAL 1 being the most basic and EAL 7 being the most stringent.

## Acquisition of cryptographic module validation

The following table lists major products certified under the Japan Cryptographic Module Validation Program (JCMVP) based on ISO/IEC 19790<sup>\*1</sup> that is operated by IPA and those certified under the Cryptographic Module Validation Program (CMVP) based on FIPS140-2<sup>\*2</sup> that is operated by the National Institute of Standards and Technology (NIST) of the U.S. and the Communications Security Establishment (CSE) of Canada (as of March 2021).

Product	Certification Number	Level
2.5-inch MHZ2 CJ hard disk drive series with an encryption function	J0006	Level1
Toshiba Solutions' encryption library	F0001	Level1
Toshiba Secure TCG Opal SSC and Wipe technology Self-Encrypting Drive (MQ01ABU050BW, MQ01ABU032BW and MQ01ABU025BW)	F0022	Level2
Toshiba TCG Enterprise SSC Self-Encrypting Solid State Drive (THNSB8 model)	2807	Level2

\*1 ISO/IEC 19790: Information technology – Security techniques – Security requirements for cryptographic modules. An international standard for their testing and certification

\*2 FIPS140-2: Federal Information Processing Standard that stipulates the security requirements for cryptographic modules that include both hardware and software components

## Acquisition of other security certifications

Certification	Product	Level
Achilles Communications Certification	TOSMAP-DS/LX OWB	Level2
	TOSMAP-DS/LX OWR	Level2
ISA Secure® EDSA (Embedded Device Security Assurance) certification	CIEMACTM-DS/nv (TOSDIC-CIEDS/nv) Unified Controller nv series type2	EDSA2010.1 Level1

# Pursuit of the Sustainable Development Goals (SDGs)

In pursuit of digital transformation, manufacturing industry is required to enhance cyber security of information technology (IT), operation technology (OT), and the Internet of Things (IoT). Toshiba Group offers its views on the security of products and systems throughout their life cycles and endeavors to enhance its cyber security system so as to contribute to the SDGs from the following four angles:

## Goal 9: Innovation

We promote security measures from both cyber and physical perspectives to counter increasingly sophisticated cyberattacks.

## Goal 11: Smart cities

We support the safety and security of social infrastructure for smart cities through security technology.

## Goal 12: Sustainable consumption and production

We establish the reliability of supply chains, aiming at value creation by global value chains.

## Goal 17: Partnership

We continuously adopt state-of-the-art security measures through partnership with global security vendors.

## SUSTAINABLE DEVELOPMENT GOALS

# Toshiba Group Business Overview

As of March 31, 2021

## Company Overview

**Company Name:** TOSHIBA CORPORATION  
**Headquarters Address:** 1-1-1 Shibaura, Minato-ku, Tokyo 105-8001, Japan  
**Founded:** July 1875  
**Paid-in capital:** ¥200,558 million

**Consolidated Net Sales:** ¥3,054.4 billion  
**Number of Employees:** 117,300 (consolidated)  
**Number of Shares Issued:** 455.28 million shares  
**Stock Exchange Listings:** Japan: Tokyo and Nagoya

## Consolidated business results

### Net sales

### Changes in operating income and net income(loss)

### Net sales by region

### Number of employees by segment

### Net sales by segment

(Including an inter-segment elimination of 244,200 million)

**Committed to People, Committed to the Future.**

## **Toshiba Corporation**

1-1, Shibaura 1-chome, Minato-ku, Tokyo, 105-8001, Japan

### **Contacts:**

Corporate Technology Planning Division, Cyber Security Center
